Universal Registration Document 2025

including the Annual Financial Report

TotalEnergies

1.1 TotalEnergies at a glance

1.1.1 An integrated energy company

TotalEnergies is a global integrated energy company that produces and markets energies: oil and biofuels, natural gas, biogas and low-carbon hydrogen, renewables and electricity. Our more than 100,000 employees are committed to provide as many people as possible with energy that is more reliable, more affordable and more sustainable. Active in about 120 countries, TotalEnergies places sustainability at the heart of its strategy, its projects and its operations.

Values anchored in our daily activities

Safety, Respect for Each Other, Pioneer Spirit, Stand Together and Performance-Minded are what drive us. These values guide daily the actions and relations of the Company with its stakeholders.

These five values also require all of TotalEnergies' employees to behave in an exemplary manner. Priority is given to safety, security, health, the environment, integrity in all its forms (including the fight against corruption, fraud and anti-competitive practices) and human rights.

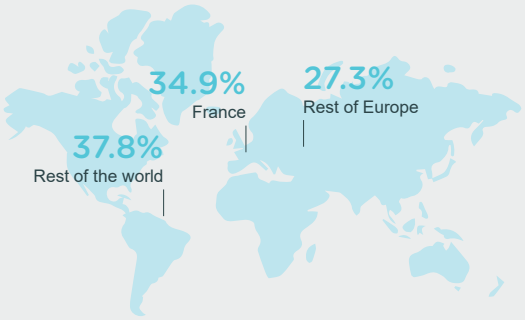

It is through the strict adherence of our employees to these values and to this course of action that our Company intends to build strong and sustainable growth for ourselves and for all of our stakeholders.

In this way, we deliver on our commitment to better energy.

Our profile

Our employees

Employees breakdown by geographical area

Workforce as of December 31, 2025: 101,513

Employees breakdown by gender

36.7% Women

63.3% Men

Proven expertise in 2025

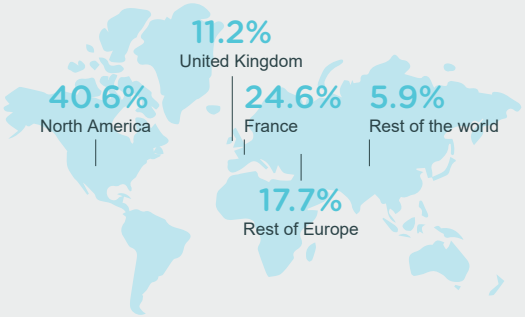

- **101,513** employees
- Nearly **170** nationalities
- More than **510,000** days of training
- More than **400** talent developers to help employees along their professional development path

Employees in 2025

- **$10.0 billion** payroll (including social security charges)
- Close to **€220 M** for training
- **93.4%** of employees on permanent contracts, and women account for **39.2%** of employees hired on permanent contracts
- **87.9%** of employees hired by the Company and **70.5%** of managers hired were non-French nationals

Our shareholders

Shareholding structure by geographical area[a]

Shareholding structure by shareholder type[a]

Estimate as of December 31, 2025, based on the request for the identification of shareholders made on that date, pursuant to Article L. 228-2 of the French Commercial Code.

74.0% Institutional shareholders

9.2% Company employees[2]

16.9% Individual shareholders

Around 2 million individual shareholders

(a) Excluding treasury shares.
(b) On the basis of employee shareholding as defined in Article L. 225-102 of the French Commercial Code and Article 11 paragraph 6 of the Articles of Association of the Corporation.

Marketing & Services petroleum product sales[6] by geographic area *(kb/d)*

Production of biofuels

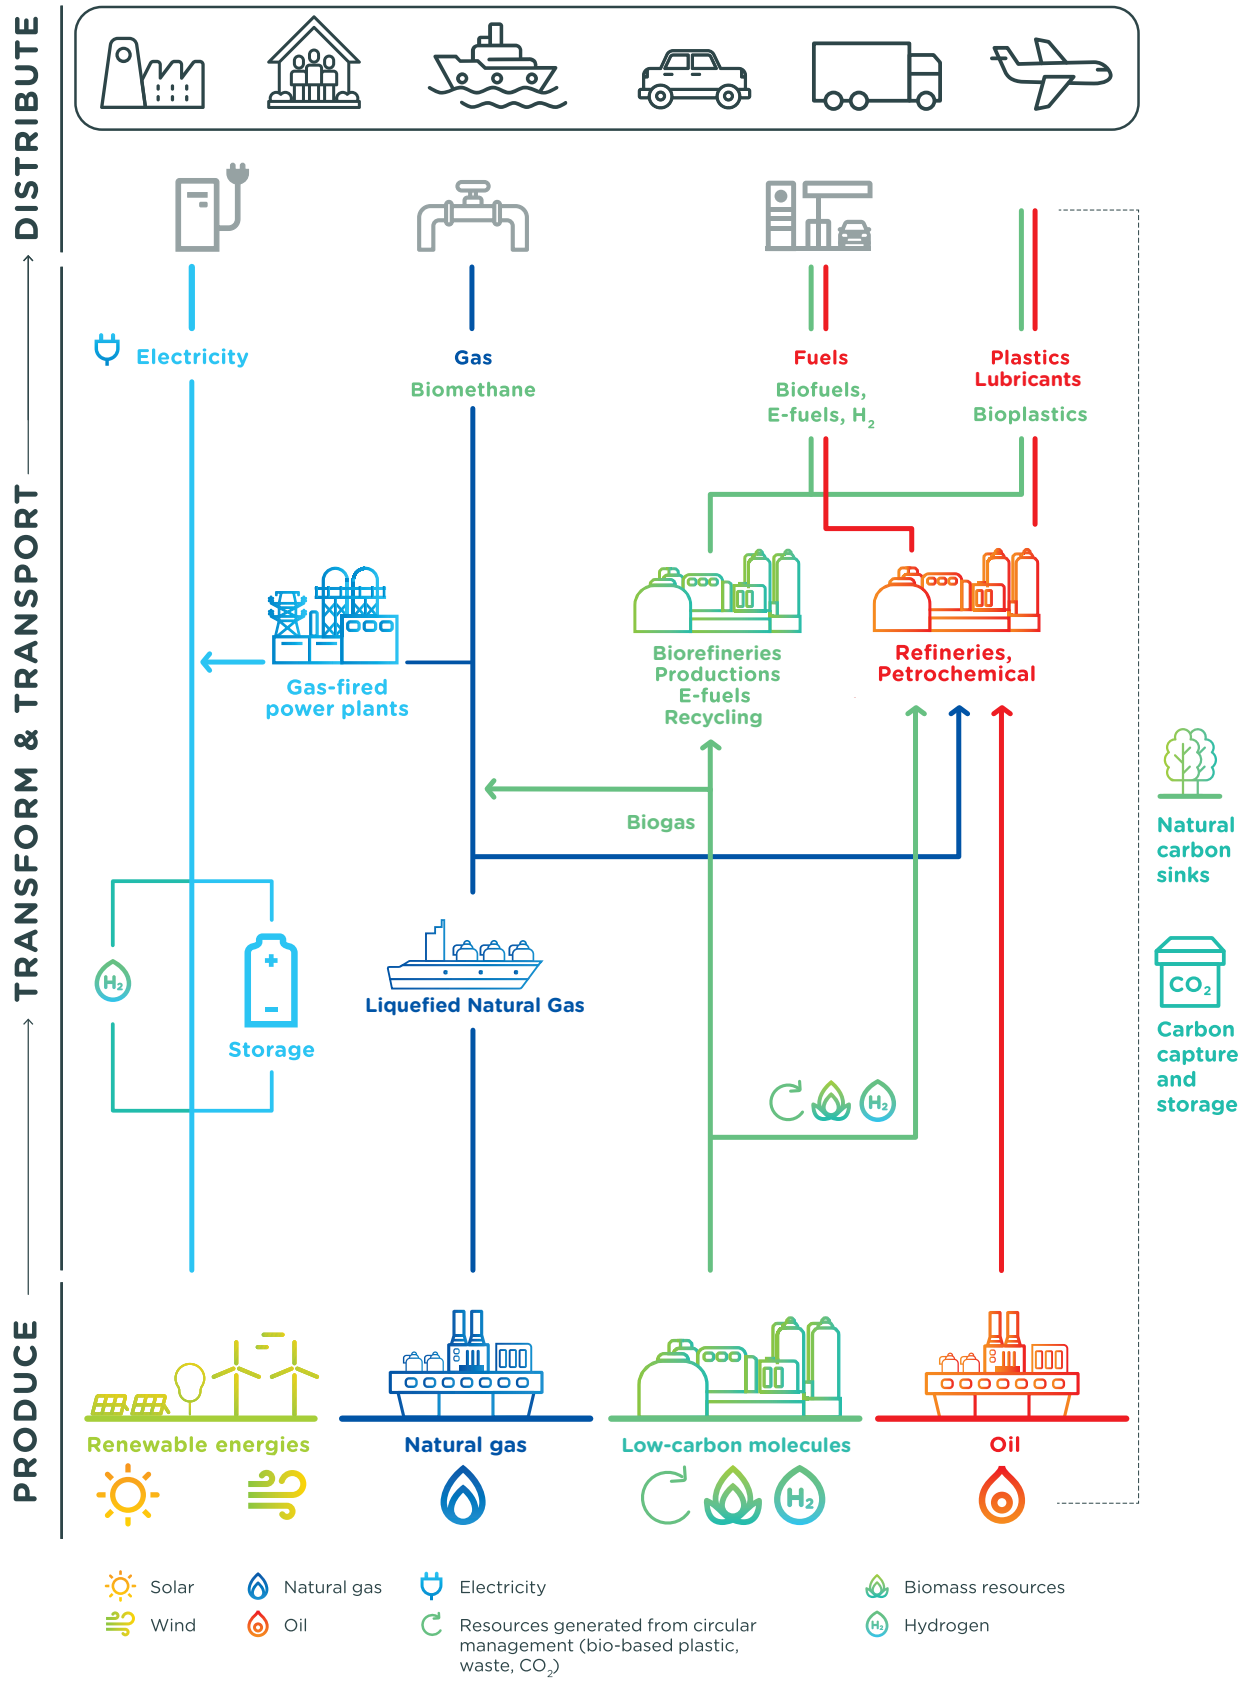

(kt)

(1) Based on SEC rules (Brent at $69.51/b in 2025, $81.17/b in 2024 and $83.27/b in 2023).
(2) Capacity data based on crude distillation unit stream-day capacities under normal operating conditions, less the average impact of shutdowns for regular repair and maintenance activities.
(3) Including 50% of the joint-venture between TotalEnergies and Borealis.
(4) Including interests in Qatar, 50% of the capacities of Hanwha TotalEnergies Petrochemical Co. Limited and 37.5% of SATORP in Saudi Arabia.
(5) Olefins.
(6) Excluding trading and bulk refining sales.
(7) Including Turkey.
(8) Including Indian Ocean islands.

1.1.3 Our business model

Integrated value chain

Resources and ecosystem

Proven expertise

- **101,513** employees
- Close to **170** nationalities
- Close to **510,000** days of training
- More than **400** talent developers to help employees along their professional development path

A responsible innovation

- R&D budget: **$810 million**
- **15** R&D centers worldwide

Top-tier industrial and commercial assets

- **34.1 GW**(1) of gross installed renewable power generation capacities
- Close to **90,000** operated and supervised EV charging points
- Proved reserves of **11.2 Bboe** and hydrocarbon production of **2,529 kboe/d**
- **14** refineries including **1** biorefinery (La Mède); 1 biorefinery currently being converted (Grandpuits)
- **26** petrochemical sites including **6** integrated platforms (refining-petrochemicals)
- **84** specialty chemicals production sites
- **36** production sites operated (lubricants and greases)
- Close to **13,000** service stations in approximately **60** countries

Solid financials

- Cash flow from operations excluding working capital (CFFO): **$27.8 billion**
- Net investments: **$17.1 billion**
- Gearing ratio (excluding leases): **14.7%**
- Pre-dividend organic cash breakeven: **$26.4/b**

Geographic reach

- Present in about **120** countries
- Hydrocarbon exploration and production in about **50** countries

Environment

- Fresh water withdrawal: **99 Mm³** (ESRS perimeter)(3)
- Net primary energy consumption: **150 TWh** (operated perimeter)

Data as of December 31, 2025.

Shared value creation

Employees

- **$10.0 billion** payroll (including social security charges)
- More than **€210 million** for training
- **93.4%** of employees on permanent contracts and women account for **39.2%** of employees hired on permanent contracts
- **87.9%** of employees hired by the Company and **70.5%** of managers hired were non-French nationals

Customers

- Sales: **$201 billion**
- **3rd** largest LNG player worldwide with **43.9 Mt** of LNG sold in 2025, including **15.1 Mt** from equity production of the Company
- **48.1 TWh** of net power production, including **31.4 TWh** from renewable sources
- **89.2 TWh** of gas delivered to **2.7 million** BtB and BtC clients sites
- **48.8 TWh** of power delivered to **6.0 million** BtB and BtC clients sites
- More than **8,000** patents in force worldwide

Suppliers

- **$35 billion** worth of purchases of goods and services, from a network of more than **100,000** suppliers, supporting hundreds of thousands of direct and indirect jobs worldwide

Shareholders

- **$8.1 billion** distributed as dividends(2)
- Around **2 million** individual shareholders
- More than **70%** of employees are shareholders

Communities

- Fostering social and economic development in host countries with contributions amounting to **$8,785 million** in income tax, **$10,646 million** in production taxes paid by EP activities, **$2,490 million** in employer social charges and **$18,852 million** in excise taxes
- A global integrated local development approach (in-country value)

Climate

- Reducing GHG emissions (Scope 1+2) from operated facilities from 46 Mt CO_2e in 2015 to **33 Mt CO_2e** in 2025
- Reducing methane emissions(4) from operated facilities by **50%** between 2010 and 2020 and by **65%** between 2020 and 2025
- Scope 3(5) GHG emissions at **335 Mt CO_2e** in 2025, below the level of 2015
- Reducing Scope 3 GHG emissions of the petroleum products sold worldwide by **41%** in 2025, compared to 2015
- Reducing lifecycle carbon intensity(6) of energy products sold by **18.6%** between 2015 and 2025

(1) Includes 17.25% of Adani Green Energy Ltd's gross capacity, 50% of Clearway Energy Group's gross capacity and 49% of Casa dos Ventos' gross capacity.
(2) Excluding dividends paid to non-controlling minority interests.
(3) As defined in point 5.2.1.1 of chapter 5.
(4) Excluding biogenic methan.
(5) GHG Protocol – Category 11 (refer to the glossary).
(6) Lifecycle carbon intensity of energy products sold (refer to the glossary).

1.2 Our transition strategy

1.2.1 Global challenges: more energy, less emissions

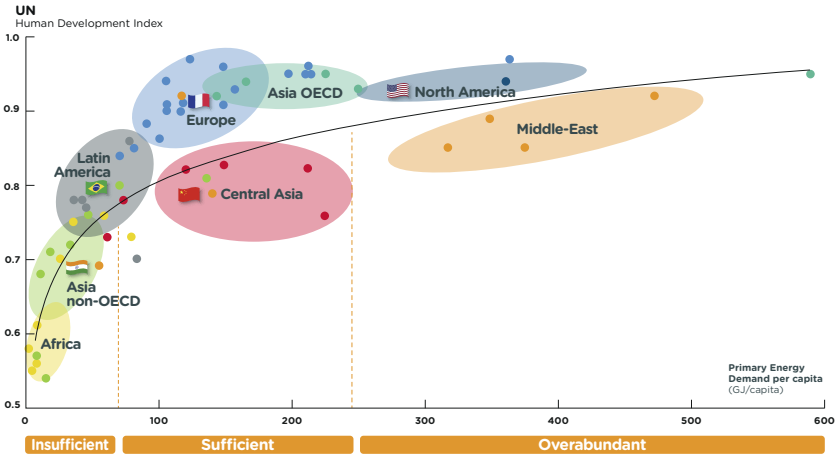

Since the Paris Agreement in 2015, states have made a joint commitment *"to strengthen the global response to the threat of climate change, in the context of sustainable development and the fight against poverty, including by containing the rise in global average temperature to well below 2 °C above pre-industrial levels and continuing action to limit the rise in temperature to 1.5°C above pre-industrial levels."*

TotalEnergies supports the objectives of the Paris Agreement and is deploying a strategy to meet the needs of both development and energy transition: more energy and less emissions.

More energy to fuel human development

Energy access is essential to human development

The United Nations Human Development Index (HDI) measures well-being in terms of health, education and living standards (GDP). HDI increases dramatically with energy access for low levels (below ~70 GJ/cap). Above 240 GJ/cap incremental energy does not significantly improve human development.

Access to energy is essential for human development. The figure above, adapted from the work of energy historian Vaclav Smil, shows that the human development index inceases with the energy available per capita. The available energy must exceed the threshold of 70 GJ/capita to reach an index level deemed sufficient.

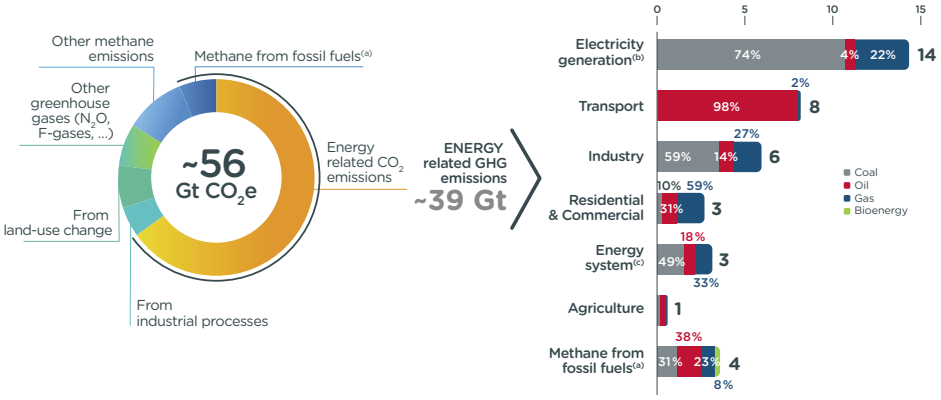

Today, around 4.6 billion people live below this threshold. Getting them there today would require a 3-fold increase in the energy available to them. By 2050, taking into account the demographic growth of these populations, the energy available will have to be multiplied by 4.

Recent history shows that such an increase is possible: between 2000 and 2022, China increased its available energy per capita by a factor of 3, from ~40 to ~120 GJ/capita, lifting ~800 million people out of poverty. This historic economic and social development resulted from the massive exploitation of coal, an abundant and often cheap source of domestic energy.

The challenge of the energy transition is therefore twofold: (i) to decarbonize the "mature" energy systems of developed countries, and (ii) to increase the energy available in the Global South and India by fuelling economic and social development with low-carbon electricity rather than coal.

Less emissions

Global anthropogenic GHG emissions in 2023 *(Gt CO_2e)*

Available technologies to reduce GHG emissions and their potential impact

Renewables combined with Flexible Gas to displace coal from the electricity system: up to ~8 Gt CO_2e

Electrification to decarbonize road transport: up to ~6 Gt CO_2e

Heat pumps to replace fossil boilers: up to ~2 Gt CO_2e

Elimination of venting & flaring and leak detection & repair to cut emissions from fossil fuels production: up to ~4 Gt CO_2e

(a) "Methane from fossil fuels", includes methane emissions from the production and transport of fossil and bioenergy fuels.
(b) Including heat combined with power.
(c) Includes energy sector own use, transport losses and energy transformation.
Sources: IEA, Enerdata, UNEP, CITEPA, EDGAR, TTE analysis.

In 2023, GHG emissions from the energy system accounted for 39 billion tonnes of the 56 billion tonnes of anthropogenic GHG emissions. Burning coal to produce electricity is the biggest contributor, at around 10 Gt CO_2, followed by using oil for transport, at around 8 Gt.

Since 2023, the decoupling between global energy demand and CO_2 emissions from the energy system has been clearly widening. Already observable since the Paris Agreement (with annual emissions growth limited to +0.9%, compared with +1.6% for energy demand), this trend has strengthened: between 2023 and 2024, primary energy consumption increased by 2.2%, while the associated CO_2 emissions rose by only 0.8%. The decline in the carbon intensity of the global energy system has become clearly measurable.

The global deployment of mature and competitive low-carbon technologies would make it possible to eliminate around 20 of these 39 Gt:

- solar and wind – and natural gas to ensure the long-term balancing of the system – to produce electricity;
- electric vehicles and heat pumps to use it, and
- technologies to reduce methane emissions in the energy system.

Reconciling economic and social development with the fight against climate change requires a pragmatic approach to deploy low-carbon technologies at a global scale, taking into account their cost (cost merit curve) and technological maturity.

While real progress has been made since the Paris Agreement, experts now consider the goal of limiting global warming to +1.5 °C by 2100 to be out of reach. Achieving it would require, in particular, significantly strengthened international cooperation and massive financial support to enable developing countries to accelerate their decarbonization well beyond current trends.

1.2.2 A two-pillar multi-energy strategy

TotalEnergies stays the course of its balanced integrated multi-energy strategy...

TotalEnergies reaffirms the relevance of its balanced integrated multi-energy strategy considering the developments in the oil, gas and electricity markets. Anchored on two pillars, oil & gas, notably LNG, and electricity, the energy at the heart of the transition, the Company plans to increase its energy production (hydrocarbons and electricity) by +4% per year between 2024 and 2030 and is in a very favorable position to take advantage of energy prices evolution. Thanks to the refocusing of the oil & gas portfolio on assets and projects with low breakeven and low greenhouse gas emissions, and to the diversification into electricity, notably renewable, through an integrated strategy from production to customer, the Company is implementing its transition strategy while ensuring an attractive shareholder return policy.

... responsibly producing low cost, low emissions oil & gas...

While drastically lowering the emissions of greenhouse gas from its operations, TotalEnergies plans to grow its oil & gas production by around 3% per year over the next five years, predominantly from LNG, thanks to its rich low cost, low emission project portfolio which has been the subject of major investment decisions in 2025 to ensure its medium-term growth.

The Company will put more than ten projects into production by 2030 starting from 2025-2026, in oil in the United States, Brazil, Iraq and Uganda and in gas in Argentina, Nigeria, Malaysia, Qatar and Mexico.

In 2027 and 2028, the start-ups of LNG projects will follow in Qatar, the United States, and Oman. At the same time, the Company strengthens its leading position in Europe in regasification and its leading LNG exporter position in the United States.

The oil projects developed, like the liquefaction plant projects, are well positioned on their respective merit curves, enabling them to generate value for the Company, even in a low-price scenario. The key indicator of its progress on this pillar is the reduction in Scope 1+2 emissions of its oil & gas assets because its first duty as a producer of hydrocarbons is to reduce the greenhouse gas emissions linked to their production.

... and developing a profitable and differentiated Integrated Power model to create a future cash engine of the Company.

TotalEnergies is replicating its integrated oil & gas business model into the electricity value chain to achieve a profitability (ROACE[1]) of ~12% for the Integrated Power segment, equivalent to Upstream oil & gas ROACE at 60 $/b, above the returns of the traditional Utilities model.

The Company is building a world class cost-competitive portfolio combining renewable (solar, onshore wind, offshore wind) and flexible assets (CCGT, storage) to deliver low-carbon electricity available 24/7. In particular, TotalEnergies is leveraging its scale effect in equipment purchases and digital to lower its operational costs in its renewable assets.

TotalEnergies also uses the strength of its balance sheet to increase its market exposure from 10% in 2024 to 30% in 2030, allowing it to capture additional margins in a volatile market. Finally, the last lever is the recycling of capital through farm-downs of post-development assets in order to reinvest in new projects.

The Company plans to increase its annual electricity production to 100-120 TWh (mainly from renewable sources) by 2030 by allocating a significant investment effort to low-carbon energies, mainly in the Integrated Power segment of $3 to $4 billion per year for the period 2026-2030, including approximately $1 billion per year on average over five years in shares as part of the transaction with EPH[2]. In 2025, the generated cash flow of this segment was $2.6 billion and is expected to exceed $3 billion in 2026, the Integrated Power segment becoming net cash flow positive from 2027.

Additionally, TotalEnergies also invests in a targeted manner in low-carbon molecules (biofuels, SAF and biogas, as well as hydrogen and its derivatives: e-fuels) as part of an “equity light” business model with partners.

The key indicator of its progress to measure our transition towards low-carbon energy products is the lifecycle carbon intensity[3] of the energy products used by the Company’s customers. The reduction in carbon intensity reflects the lower carbon content of the energy sold to our customers and the Company’s progress in implementing its transition strategy. This intensity decreased by 18.6% between 2015 and 2025.

(1) Refer to the glossary for definitions and additional information on alternative performance measures (APM, Non-GAAP measures) and to point 1.8 for reconciliation tables.
(2) The transaction remains subject to information-consultation processes and regulatory approvals, with completion expected in mid-2026.
(3) Lifecycle carbon intensity of energy products sold (refer to the glossary).

1.2.3 TotalEnergies' ambition in terms of sustainable development and energy transition towards carbon neutrality, together with society

1) TotalEnergies' Climate Ambition

TotalEnergies supports the Paris Agreement, with its call to reduce greenhouse gas emissions in the context of sustainable development and poverty eradication, and its overarching goals to limit planetary warming to well below 2 °C by 2100 compared with pre-industrial levels.

Climate change is a reality and requires the collective mobilization of all stakeholders. The 2015 Paris Agreement significantly raised the awareness of the need to tackle climate change and prompted an enhancement of collective action to start transitioning the global energy system.

A massive transformation of the world's energy systems is needed to achieve the Paris goals. The dual challenge of "more affordable energy for all and less carbon emissions" is a challenge for society as a whole, where governments, investors, companies and consumers all have important roles to play.

In 2020, TotalEnergies outlined for the first time its ambition to aim for carbon neutrality together with society. The adoption of this ambition was supported by the strategy to become a broad-based energy company, expanding from oil and gas to low carbon electricity and other low carbon energies. It was also part of a shareholder dialogue process with Climate Action 100+ (CA 100+), a coalition of investors committed to the energy transition. This ambition set out three steps for TotalEnergies to get to Net Zero together with society: net zero for TotalEnergies' global operated emissions (Scope 1+2), net zero covering direct and indirect emissions (Scope 1+2+3) in Europe, and a 60% reduction in the average carbon intensity of energy products sold to our customers (CI) globally by 2050 compared to 2015.

In 2021, as a result of a continuous dialogue with some shareholders, the Board of Directors broadened the net zero ambition together with society so as to cover direct and indirect emissions (Scope 1+2+3) on a worldwide basis.

Within the framework of its first corporate sustainability report (CSRD) published in March 2025 as required by the EU, TotalEnergies characterized its "together with society" approach by underlining some dependencies and uncertainties: "*The energy transition requires the participation of all stakeholders, from regulatory authorities to end customers and industrial players. TotalEnergies is deploying a strategy that supports this collective transition and will enable our Company to adapt to the various scenarios that may materialize depending on developments in low-carbon technologies (speed of penetration, cost reduction), geopolitical relations, international trade, and consumer behavior.*"

2) TotalEnergies' energy transition strategy supporting the Ambition

As part of this Ambition, the Company has defined and consistently implemented a balanced transition strategy based on two pillars:

– An *Oil & Gas* pillar centered on low cost and low emission projects: the Company continues to invest in existing fields and new oil and gas projects, and plans to increase its production of hydrocarbons – mainly LNG, a key energy source for the energy transition – by 3% per year on average until 2030, so as to meet growing energy demand and fight the natural decline of oil and gas fields (averaging 6-7% per year for the industry according to the 2025 IEA report). In parallel, TotalEnergies has published a roadmap to reduce emissions from its operations: it aims to achieve a 40% net reduction in its operated emissions (Scope 1+2) in 2030 compared to 2015, and an 80% reduction in its operated methane emissions in 2030 or sooner compared to 2020.

– An *Integrated Power* pillar: the Company is building a competitive portfolio of renewable (solar, onshore wind, offshore wind) and flexible assets (CCGT, storage) to provide its customers with low-carbon electricity available 24 hours by 7. We plan to increase our electricity production to more than 100 TWh by 2030, which would represent 20% of our energy production by that date. In addition, we are investing in low-carbon molecules, particularly biofuels and sustainable aviation fuels (SAF).

A key measure of our contribution to the transition of our customers and the global energy systems is the life-cycle Carbon Intensity of the energy products sold to our customers (CI). The decline in our CI reflects our progress in implementing our transition strategy, since it means that the carbon content of the energy products we sell to our customers is decreasing, on an energy unit basis. In 2025 our life-cycle Carbon Intensity was down by more than 18% compared to 2015. By 2030 we target a reduction of 25%.

Our 2025 earnings demonstrate that our differentiated strategy built around these two pillars is delivering best in class returns, thereby creating long term value for our shareholders while supporting our climate ambition.

3) Ten years after the Paris Agreement: Confronting Net Zero ambitions to realities

While the Company's transition strategy is based on solid market fundamentals and will be consistently pursued, the Company notes that the context in which its Ambition was adopted has evolved.

a) **Ten years after the Paris Agreement, the global energy system has progressed** by enabling the continued development of emerging economies while reducing the carbon intensity of the energy mix. Affordable low-carbon technologies have experienced spectacular growth, for example solar panels or, in some parts of the world, electric vehicles. Yet the share of fossil fuels in the overall energy mix has hardly moved (from 82% to 80%) because the cleaner energy sources have not eliminated traditional energies but have mostly been added to the existing system as population and energy demand continue to grow steadily.

Since 2015, economic and geopolitical conditions have shifted, with rising interest rates making transition finance more expensive and the weaponization of energy putting energy security at the top of every country's agenda. States have to balance the energy trilemma between energy reliability, energy affordability and sustainability. Non-State actors have had to balance these competing priorities too.

Our societies and economies have initiated an energy but the global economy is not yet achieving the pace of change required to meet the Paris Agreement objectives.

Against this backdrop, at COP30 in Belem in Nov. 2025, there was a common finding – by UNFCCC, UNEP and the international community – that **the updated Nationally Determined Contributions for 2035 provided by the States fall behind what is needed to reach the Paris goals.**

b) **The current scientific consensus now emphasizes that the goal of limiting global warming to 1.5°C above pre-industrial levels is out of reach**. Climatologists, including ones contributing to the IPCC work, and scientists have explicitly shared these views with the media and the public at large in 2025. Similarly, the International Energy Agency states in its 2025 World Energy Outlook report that "*It is now all but certain that 1.5°C of warming will be exceeded within a decade or less, and that pathways that limit this overshoot of 1.5°C to low levels have now slipped out of reach*."

These scientific findings are closely linked to the inertia of the energy system, which still relies on fossil fuels for nearly 80% of its energy: despite the massive deployment of solar and wind, coal still plays a dominant role in electricity generation and accounts for three-quarters of the 14 billion tons of CO_2 emitted each year by power plants; the penetration of low-carbon technologies to electrify and decarbonize uses is hampered by cost considerations and sometimes by technological maturity constraints.

c) **The legal and regulatory framework applicable to sustainability and climate has evolved**.

For European companies, the corporate sustainability reporting directive (CSRD) and associated reporting standards (ESRS) in force since 2025 have established a legally binding framework: targets using the words "net zero" require the adoption of "transition plans" (as defined by the regulations), and companies that adopt such plans must explain how these plans are compatible with a warming trajectory of 1.5°C by 2050 — which we know the scientific consensus now considers out of reach.

Based on the current state of scientific knowledge, in light of the growing heterogeneity of energy pathways at the global level, the reliance by forward-looking scenarios on assumptions that may not materialize, and the ongoing uncertainties regarding the evolution of global energy demand, worldwide GHG emissions and the effective pace of deployment of low-carbon technologies, **the Company is not in a position to adopt a transition plan as defined by the European reporting standards and, as a result, cannot formulate "Net Zero" targets in the meaning of these standards.**

4) The pathways to our carbon neutrality ambition together with society will need to be reassessed and adapted over time

In order to take these realities into account, particularly the legal framework created by the European corporate sustainability reporting directive regarding "Net Zero" taxonomy, TotalEnergies has no choice but to evolve the wording and to precise the dependencies of its carbon neutrality ambition, together with society.

"More Energy, Less Emissions, Fully engaged in our transition strategy"

TotalEnergies is fully engaged in its balanced, value-creating, transition strategy based on 2 pillars: an oil & gas pillar and an integrated power pillar.

This transition strategy supports TotalEnergies' ambition for carbon neutrality, together with society, within the framework set out by the Paris Agreement's objectives.

We acknowledge that our ability to achieve carbon neutrality is linked to our own efforts and to society's broader progress in this area.

Therefore:

- **TotalEnergies aims to achieve carbon neutrality for its global operated emissions (Scope 1+2) by 2050**
- **The Company works proactively with its customers to help execute their own energy transition strategies and puts on the market a mix of energies with a lower carbon intensity year after year.**

Our ability to do so depends critically on the pace and affordability of technical innovation, on public policies and on consumers' behavior. **This is what is encapsulated in "together with society".** Without the right policies and enough cost-efficient innovation, carbon neutrality by 2050 will remain out of reach – for society and for TotalEnergies. **As a result of these dependencies, the pathways to our carbon neutrality ambition will need to be reassessed and adapted over time.**

On the way to its ambition, **TotalEnergies confirms its targets set for 2030 for reducing emissions worldwide**: a 40% net reduction of its Scope 1+2 operated emissions compared to 2015, an 80% reduction of its operated methane emissions in 2030 or sooner compared to 2020 and a 25% reduction of its life cycle carbon intensity (CI - Scope 1+2+3) of the energy products sold to its customers compared to 2015.

1.2.4 2030: Our objectives for more energy and less emissions

Over the decade 2020-2030, TotalEnergies' energy transition strategy based on two pillars is reflected in the production targets shown below.

TotalEnergies plans to **increase its energy production (oil, gas and electricity), overall by 4% per year between 2024 and 2030.**

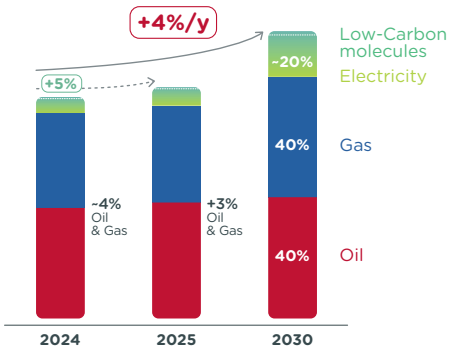

In 2025, its electricity production accounted for nearly 10% of its hydrocarbon production. Its objective is to increase it to 20% in 2030.

At the same time, the Company is pursuing its trajectory of reducing its emissions (Scope 1+2 CO_2 and methane) from its operated facilities with the view to reducing net emissions(1) by 40% by 2030 compared with 2015 and to reducing its operated methane emissions by 80% in 2030 or sooner compared to 2020.

The growth of its electricity sales allows the Company to target a 25% reduction in the lifecycle(2) carbon intensity of its sales by 2030 compared to 2015.

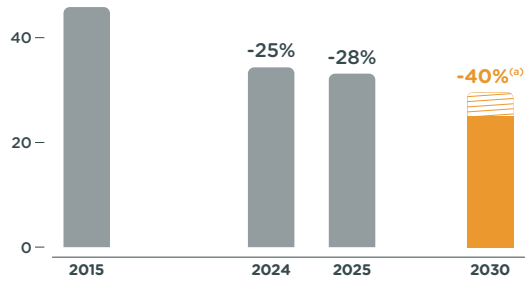

(1) The calculation of net emissions includes nature-based carbon sinks projects as of 2030.
(2) Lifecycle carbon intensity of energy products sold (refer to the glossary).

1.2.5 Producing oil differently: Focus on low-cost and low-emission oil assets

Global demand for petroleum products reached 104.0 Mb/d in 2025, i.e. +0.8 Mb/d (+~1%) compared to 2024, and should continue to grow over the decade (105.5 Mb/d by 2030 according to the IEA). Beyond 2030, the trajectories of the different forecasters vary between moderate growth, plateau and start of decline. These demand forecasts remain dependent in particular on population and economic growth, market penetration pace of low-carbon technology innovations such as electric vehicles and changes in behavior.

In addition, demand for petroleum products should evolve in a differentiated way according to the specific energy transition roadmaps of the various countries. It is expected to continue increasing through 2030-2040, and could begin to decline thereafter, but at a slower pace than the natural decline rate of existing fields, which the IEA estimates at an average of 8% per year over the next decade[(1)].

Global liquid demand and population[(a)] *(Mb/d)*

(a) Sources: 2015-2025 oil demand: IEA historical data, IEA Oil Market Report (January 2026). 2026–2030 oil demand: TotalEnergies projection. Population: United Nations World Population Prospects 2024.

(1) Source: The Implications of Oil and Gas Field Decline Rates (IEA, September 2025).

TotalEnergies therefore believes that new oil projects are still needed to meet this demand and to keep prices at an acceptable level in order to create the conditions for a just transition that gives people time to adapt their energy use. In 2025, TotalEnergies produced 1.4 Mb/d of oil, equivalent to its 2019 level, representing around 1.5% of world production.

TotalEnergies' first responsibility as an oil producer is to produce differently, by reducing emissions to the minimum. To that end, it approves hydrocarbon projects on the basis of performance criteria, notably technical costs and carbon intensity (Scope 1+2). The Company operates its fields in accordance with strict requirements concerning safety, emissions reduction and environmental impact. The cash flow generated by these Oil and Gas activities contributes to financing its investments in renewable energy.

1.2.6 Liquefied Natural Gas: a key fuel for the energy transition

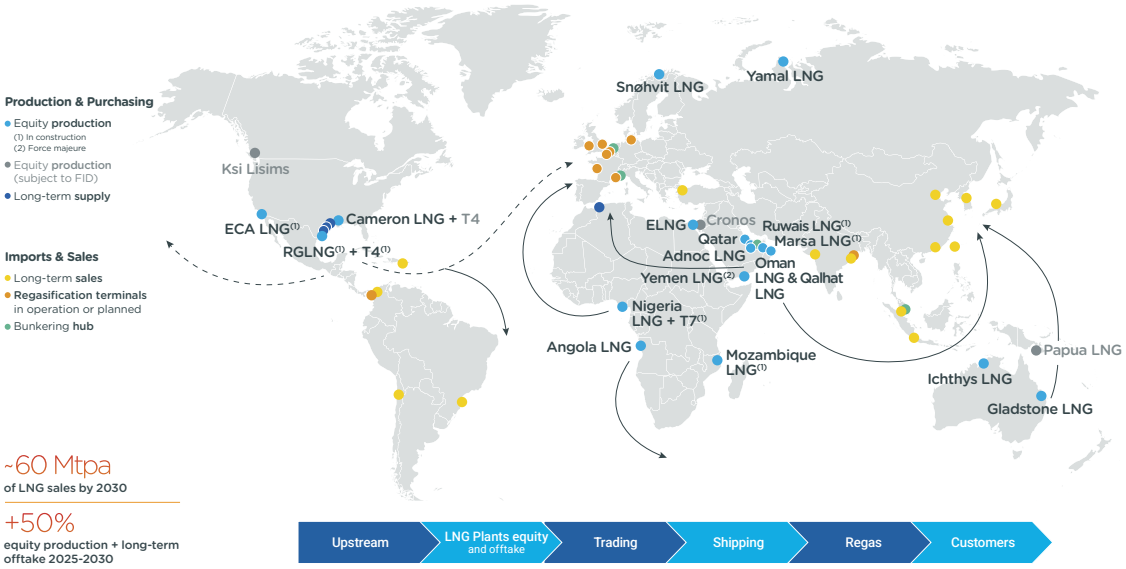

In the gas markets, TotalEnergies focuses on Liquefied Natural Gas (LNG), which can be shipped everywhere in the world and thus contributes to energy security, as it has been the case in Europe where pipeline deliveries of Russian gas have sharply declined since 2022 and fell further with the halt of transit through Ukraine at the end of 2024.

The growth of renewable electricity, intermittent and seasonal by nature, will require an increase in flexible power generation resources. The dispatchable generation of gas-fired power plants helps secure electricity supply against weather variability affecting renewables, while also responding to fluctuations in demand. In addition, natural gas plays an essential role in reducing emissions from power generation as a replacement of coal, emitting half as much GHG for the same amount of electricity produced(1). It is particularly the case in Asia where coal still accounts for a very large part of the electricity mix of many countries (e.g., 60% in China, 70% in India)(2).

With diversified positions, and in particular a leading position of exporter from the United States – over 19 Mt in 2025 – TotalEnergies is the world's 3rd largest LNG player, with 44 Mt sold in 2025. In 2025, the Company also signed various LNG sales contracts with major Asian customers, particularly in South Korea and India.

In line with its balanced multi-energy strategy, TotalEnergies intends to consolidate its integrated position across the entire LNG value chain. Between 2025 and 2030, LNG volumes (from equity and long-term third-party purchases, excluding Russia after 2027) are expected to grow by 50%. TotalEnergies intends to focus on improving the flexibility and resilience of its LNG portfolio by investing in low-cost liquefaction projects, which are best positioned on the merit curve, and to continue growing its Brent-indexed sales in Asia.

A growing, diversified and flexible LNG portfolio

Reducing the carbon footprint of the LNG portfolio

TotalEnergies aims to gradually reduce GHG emissions of the LNG value chain, from gas production to end use.

In addition to its efforts to reduce methane emissions, initiatives are being implemented throughout the whole chain. The electrification of liquefaction plant processes is helping to reduce LNG's carbon footprint today, and tomorrow this reduction will be reinforced by CO_2 capture and storage projects.

Thus, the average carbon intensity of the Company's LNG liquefaction portfolio reached around 28 kg CO_2e/bep(3) in 2025. It ranges from 22 to 26 kg CO_2e/bep for new plants and can be reduced to less than 3 kg CO_2e/bep when the facility is electrified and powered by carbon-free electricity, as it is the case in the Marsa LNG project.

TotalEnergies is also working to reduce shipping emissions by renewing its fleet of chartered LNG carriers with modern, high-performing vessels. (average age of the fleet under long-term charter: 7 years versus 11 years for the global fleet of LNG carriers(4)).

All LNG carriers chartered by TotalEnergies use LNG as fuel. Furthermore, TotalEnergies actively supports the industry's efforts to reduce "methane slip" (emission of unburned methane in engines) and joined the MAMII (Methane Abatement in Maritime Innovation Initiative) in February 2024.

1.2.7 Our major development in electricity: an integrated approach

Electricity demand, which is essential to the success of the energy transition, is expected to grow sharply[1], as decarbonization is at the heart of the roadmaps of countries committed to carbon neutrality by 2050. In response, Integrated Power, the second pillar of the Company's strategy, is developing an integrated model encompassing the entire value chain, from power generation to sales and trading activities, with a profitability target of around 12% ROACE[2].

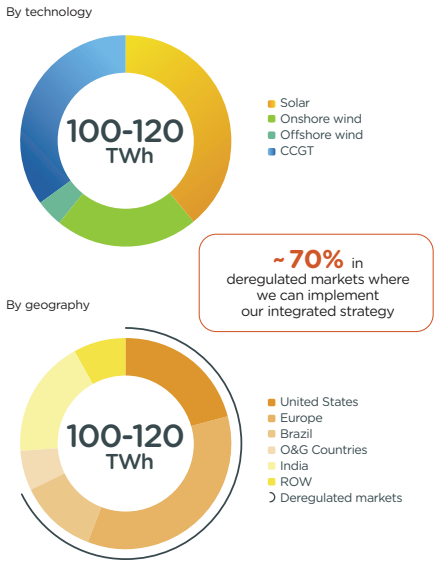

By 2030, TotalEnergies aims to achieve net electricity production of 100-120 TWh, mainly from renewable sources. As part of its transformation into an integrated multi-energy company, TotalEnergies is building a competitive portfolio of renewable (solar, onshore and offshore wind) and flexible (CCGT, storage) assets to provide its customers with an increasing share of carbon-free electricity available 24/7.

In deregulated markets, TotalEnergies deploys its integrated model across the entire value chain, from electricity generation based on renewable and flexible assets to sales and trading activities. This strategy focuses on three key areas - Europe, the United States, and Brazil - which are expected to account for around 70% of its production volumes.

In regulated markets, TotalEnergies is implementing a targeted growth strategy in renewables. In oil and gas producing countries, TotalEnergies supports the local energy transition by developing renewable electricity projects that contribute to the reduction of emissions of its oil and gas projects. This model enables renewable projects to be financed through revenues generated by oil and gas activities. In the rest of the world, TotalEnergies is pursuing selective development of renewable projects, focusing on markets large enough to benefit from economies of scale (such as India and South Africa) and through strategic partnerships with local players.

The Company' levers to grow with a return on average capital employed of around 12% are selectivity in its choices of projects; integration across the entire electricity value chain; cost control using its project management and offshore development skills; mobilizing external financing at competitive rates and farm-downs to accelerate cash flow generation and diversify its portfolio's exposure.

Power generation by 2030

1.2.8 Our renewable electricity build-up

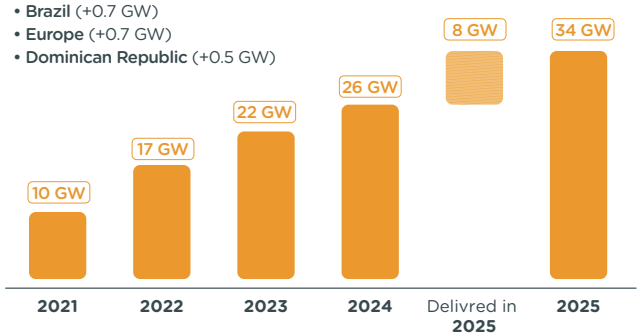

TotalEnergies is executing its roadmap in renewables, which is part of the Company's objective to reach 100-120 TWh of gross electricity generation by 2030.

At the end of 2025, TotalEnergies has reached a gross installed production capacity of 34 GW of renewable electricity and is actively pursuing the development of these activities to bring this capacity to 80 GW by 2030, a level that should make it one of the world's top five producers of renewable electricity (wind and solar), Chinese producers set aside.

Gross installed capacity of renewable electricity generation[a] *(GW)*

1.2.9 Anticipating changes in demand by adapting our sales of petroleum products

TotalEnergies' downstream business has been a steady contributor to the Company's results, while transitioning and adapting its activities to focus on high value-added markets.

The Company is addressing the sustainability challenges of its downstream activities through 3 levers:

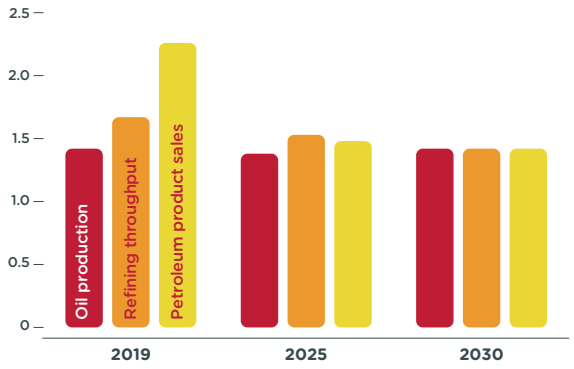

- lowering the breakeven point of its refining-petrochemicals assets in a cyclical industry;
- reducing GHG emissions from its operations;
- offering customers low-carbon mobility solutions.

In Refining & Chemicals, TotalEnergies is continuing to develop its biofuels business. It is capitalizing on its existing assets by implementing SAF production by co-processing raw materials from waste and residues (used cooking oils and animal fats), excluding first generation 1G biomass (in competition with food consumption) in jet units in operation or by converting existing refineries into biorefineries (La Mède since 2019 and Grandpuits from 2026).

For the Marketing & Services, TotalEnergies executes a three-fold *Value over Volume* strategy:

- **Network:** focusing on geographies where it has a competitive advantage, such as France, Africa and certain niche markets, in order to adapt to the evolving demand for petroleum products, particularly in Europe as part of the implementation of the "Fit for 55" program;
- **Lubricants:** differentiating ourselves through high value-added, high-margin products and developing more sustainable products to meet growing demand for circular products (RRBO[1]);
- **Electric mobility:** align its investments with the pace of electric vehicle adoption by users, develop its positions in high-power charging in Europe and deploy a low-equity business model (partnerships and leverage).

Oil production, refinery throughput and petroleum product sales *(Mboe/d)*

1.2.10 Disciplined and Sustainable Investments to Support our Strategy

TotalEnergies' annual capital expenditure target is $14 to $16 billion per year over the 2026-2030 period. TotalEnergies consistently maintains a significant level of investment in low-carbon energies, mainly in low-carbon electricity, with an investment effort in the Integrated Power segment ranging from $3 and $4 billion per year over 2026-2030, including around $1 billion per year in shares over five years as part of the transaction with EPH.

In 2025, TotalEnergies invested a total of $17.1 billion, including around $3.5 billion in low-carbon energies, mainly in the Integrated Power segment (around $3 billion). In 2026, the Company plans to invest $15 billion, including $2.5-3 billion of net investments in the Integrated Power segment, representing a total investment effort of $3.5 to $4 billion when factoring in around $1 billion in shares as part of the transaction with EPH.

Consistent with our commitment to build a multi-energy Company, we have begun publishing financial indicators for the Integrated Power segment from 2023.

Continuing to invest with discipline

In a global economic context marked by a high level of uncertainty, it is essential to maintain our investment criteria to ensure the profitability and resilience of our portfolio.

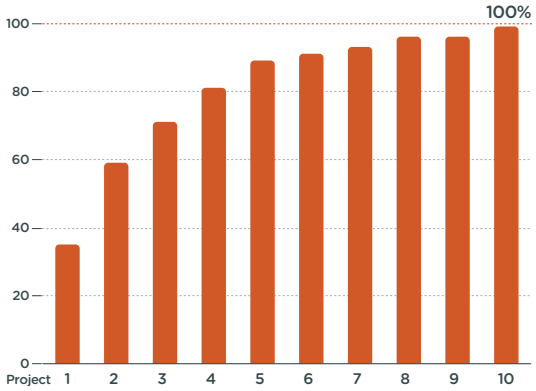

Each material investment project is assessed taking into consideration the aims of the Paris Agreement on the basis of the following criteria:

- project profitability is analyzed in a hydrocarbon price scenario compatible with the Paris Agreement objectives of limiting temperature rise to well below 2°C and with a carbon price of $100/t (or the prevailing price if higher in a given country);
- for new oil & gas projects (greenfield projects and acquisitions), the intensity of Scope 1+2 greenhouse gas emissions is compared, depending on their nature, to the intensity of the average greenhouse gas emissions of Upstream production assets or that of various Downstream units (LNG plants, refineries) of the Company. For Upstream projects, the threshold has been lowered to 16 kg CO_2e/boe, as of 2026, versus 17 kg CO_2e/boe previously – evidence of the effectiveness of our criteria. For additional investments in existing assets (brownfield projects), the investment will have to lower the Scope 1+2 emissions intensity of the asset in question. The goal is for each new investment to contribute to lowering the average intensity of the Company's Scope1+2 greenhouse gas emissions in its category;
- for projects involving other energy and technologies (biofuels, biogas), GHG emissions reductions are assessed based on the amount by which they will reduce the carbon content of our sales.

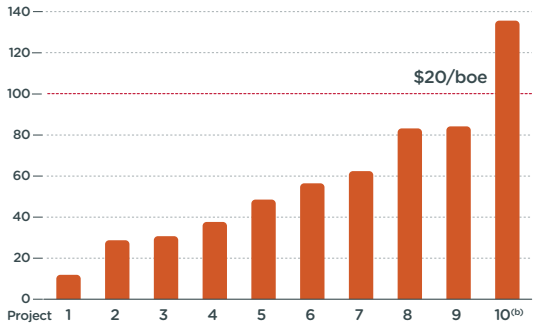

(1) Re-Refined Base Oils.

Approved Upstream oil & gas projects

GHG emission intensity vs portfolio average *(%)*

Technical costs[a]

(a) Technical costs include operating costs and investment costs.
(b) Project approved by the joint venture, no blocking right for TotalEnergies. Percentage of the reference break-even point ($30/b).

1.2.11 A Resilient Portfolio

TotalEnergies has strengthened the resilience of its portfolio through very active portfolio management in recent years: the Upstream portfolio has seen a 50% portfolio change since 2015, ensuring an oil reserves replacement ratio above 100% over 2015-2025.

Our portfolio has a low breakeven point, in line with the Company's strategic objective of keeping it below $30/b (the Company's organic cash breakeven before dividends is $26.4/b in 2025), which ensures the competitiveness of its resources. In particular, for its Upstream oil & gas assets in 2025, TotalEnergies has a production cost per barrel of $5.0/boe, the lowest among its peers[(1)] and its GHG emissions intensity (Scope 1+2) has decreased to 15.3 kg CO_2e/boe in 2025[(2)].

Furthermore, the life index of the Company's proved and probable oil & gas reserves is 18 years, and the discounted value of its Upstream oil & gas assets of more than 18 years represents less than 15% of their total value.

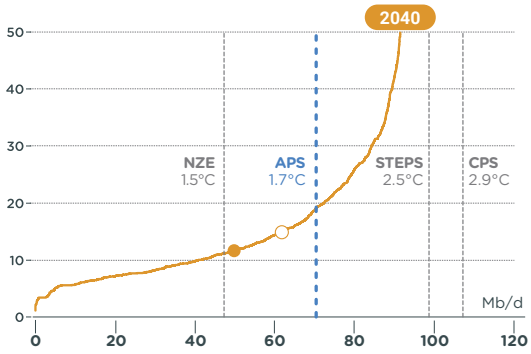

Risks of stranded assets

In June 2020, TotalEnergies determined that among its Upstream assets, only the Fort Hills and Surmont oil sands projects in Canada could be classified as stranded assets, meaning assets with reserves beyond 20 years and high production costs, whose overall reserves might therefore not be produced by 2050. TotalEnergies has sold these assets in 2023. This portfolio management approach allows TotalEnergies to mitigate the risk of stranded assets in the future if the risks of a structural decline in demand for oil & gas materialize faster than estimated as a result of stricter global environmental regulations and constraints and the resulting changes in consumer preferences.

As shown on the merit order curve of production costs for 2040 opposite, compared to the demand expected under various IEA scenarios, TotalEnergies' portfolio of Upstream Oil projects has an average technical cost that places it among the 50Mb/d lowest-cost at these horizons for its long plateau oil assets with low production costs.

Merit Curve of global oil production cost[(a)]

Technical cost *($/b)*

Global oil demand, according to IEA scenarios

● TotalEnergies - Long-plateau oil assets
○ TotalEnergies - Oil portfolio average

(a) Source: Rystad, IEA WEO 2024 (APS) and 2025 (NZE, STEPS, CPS) scenarios.

Sensitivity to CO_2, Oil and Gas prices

TotalEnergies assesses the robustness of its portfolio, including new material investments, based on relevant scenarios and sensitivity tests. Each material investment, including in the exploration, acquisition or development of oil & gas resources, as well as in other energies and technologies, is reviewed taking into account a Brent price scenario at $50/b and Henry Hub at $3/MBtu, i.e. prices lower than those of the IEA APS scenario deemed to be compatible with the objectives of the Paris Agreement; by doing so, every new investment enhances the resilience of the Compagny's portfolio.

Even though CO_2 pricing does not currently apply in all the countries where the Company operates, TotalEnergies includes as base case in its investment criteria an internal CO_2 price of $100/t (or the prevailing price in a given country, if higher) and beyond 2031, the CO_2 price is increased by 2%/y.

- Assuming a CO_2 price of $200/ton and an annual increase of 2% beyond 2031, i.e. an increase of $100/ton compared to the base case scenario, TotalEnergies estimates a negative impact of around 15% on the discounted present value of all its assets (Upstream and Downstream). In such a scenario, the value of Integrated Power's assets would increase due to higher electricity prices in Europe.

(1) Production costs ASC932. Peers: BP, Chevron, ExxonMobil, Shell.
(2) Upstream oil and gas intensity is calculated excluding integrated LNG assets.

Reducing our emissions through digital technology

In September 2025, TotalEnergies reinforced its Digital Technology Ambition through two Strategic R&T Programs: Digital for HSE and Digital Plant.

Digital for HSE aims to develop digital solutions to:

- identify, anticipate, and manage technological risks;
- improve workplace safety;
- detect and prevent pollutant emissions.

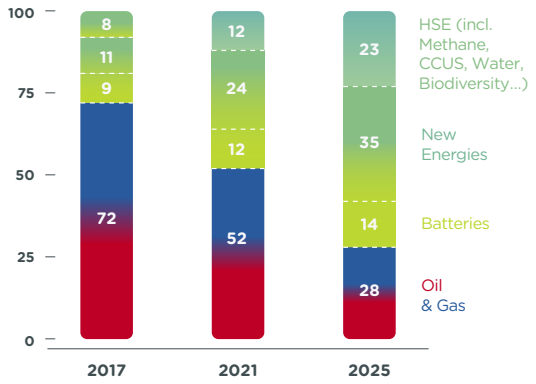

For example, **STORM** (Safety Tool for Operators and Remote Monitoring) is a digital product that illustrates the Company's efforts in digital technology for sustainable development whose deployment was initiated in 2025. STORM is an innovative digital solution developed by TotalEnergies to improve the detection and continuous monitoring of methane emissions at sites operated by on-site operators and the Methane Tracking Center in Pau. By aggregating multi-source data in real time – IoT sensors, infrared cameras, acoustic sensors, weather data, and AUSEA® drone or satellite imagery – STORM provides 2D/3D visualization that enables early identification of leaks, localization of their source, and accelerated corrective action.

Designed to facilitate the interpretation of multiple data sets while enhancing environmental performance, the tool aims to support the Company's commitment to near-zero methane emissions by 2030. Gradually deployed across E&P assets, STORM contributes to transparent reporting and a significant reduction in emissions, building the foundation for future automated quantification and OGMP 2.0 reporting capabilities.

Innovating with start-ups

To contribute to its development in the electricity sector, TotalEnergies continues to collaborate with start-ups selected through its TotalEnergies On acceleration program, based in Paris at Station F. Today, nearly 46 start-ups have been accelerated; three of them have been acquired by the Company (Nash, Predictive Layer, DS Flow) and nearly 20 commercial contracts have been signed at the end of the 6 month acceleration period.

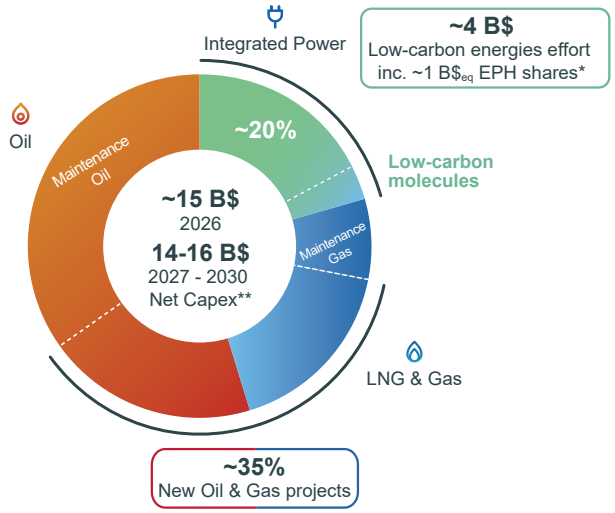

R&D budget allocation[a] *(%)*

(a) R&D budget excluding Hutchinson.

1.4 Our investment policy

Balanced and disciplined investments to deliver energy production growth

* Equivalent to 5.1 B€ over five years.
** Net Capex = organic investments + acquisitions - asset sales.

TotalEnergies' investment policy is designed to support the deployment of its balanced energy transition strategy. It is anchored on two pillars: investments for the maintenance and growth of oil and gas production, mainly LNG, on the one hand, and investments for the growth of low-carbon activities, mainly electricity, on the other hand.

Firstly, in October 2025, the Company announced a $1 billion reduction in its annual capital expenditure target to $15-17 billion per year over the next 5 years, including $3-4 billion for Integrated Power. That reduction is part of the Company's implementation of a $7.5 billion cost-saving programme (Capex + Opex) during the 2026-2030 period. The Company will remain focused on high margin Upstream projects and stay selective on low-carbon Capex, mainly for the Integrated Power business.

Secondly, in November 2025, TotalEnergies announced its intention to accelerate its gas-to-power integration strategy in Europe by acquiring 50% of a portfolio of flexible power generation assets from EPH as part of a €5.1 billion all-share transaction that was immediately earnings-enhancing for TotalEnergies shareholders(1). Due to this accelerated inorganic growth within the Integrated Power segment, the Company is lowering its annual Capex guidance by $1 billion per year to $14-16 billion per year for 2026-2030, of which $2-3 billion is for Integrated Power, while maintaining its 2030 electricity generation target of 100-120 TWh.

Overall, therefore, TotalEnergies intends to maintain a material level of investment in low-carbon energies, mainly in the Integrated Power segment, where it plans to invest $3-4 billion per year in 2026-2030, including around $1 billion per year for 5 years through shares as part of the transaction with EPH.

Net investments in low-carbon energies include investments in Integrated Power, low-carbon molecules (including biofuels, biogas, recycled plastic, biopolymers, synthetic fuels, hydrogen and CCS) as well as the nature-based carbon sinks projects allowing, from 2030, to contribute to reduction of the Company's carbon footprint.

Around 35% of TotalEnergies' net investments are expected to be dedicated to developing new low-cost, low-emission oil and gas projects, contributing to the 3% growth in hydrocarbon production between 2024 and 2030. These investments are expected to be allocated in particular to strengthening its LNG production capacity and supporting its oil production, in a context of continued growth in global demand.

(1) The transaction remains subject to information and consultation processes and regulatory approvals, with completion expected by mid-2026.

The Company maintains a downward flexibility to $14 billion per year in case of a sharp decrease of prices, under $50/b.

In 2025, TotalEnergies invested a total of $17.1 billion, including around $3.5 billion in low-carbon energies, mainly in the Integrated Power segment (around $3 billion). In 2026, the Company plans to invest $15 billion, including $2.5-3 billion of net investments in the Integrated Power segment, representing a total investment effort of $3.5 to $4 billion when factoring in around $1 billion in shares as part of the transaction with EPH.

(a) Refer to the glossary for definitions and additional information on alternative performance measures (APM, Non-GAAP measures) and to point 1.8 for reconciliation tables.

Organic investments in 2025

In the Integrated Power segment, organic investments were mainly allocated to solar and wind power plant construction projects, particularly in the United States, Germany, France, Spain and the United Kingdom.

In the Integrated LNG segment, organic investments mainly concerned LNG production projects under construction for which the final investment decision has been taken (such as NFE and NFS in Qatar, Rio Grande LNG in the United States and Marsa LNG in Oman), the Mozambique LNG project in preparation for the resumption of the project announced in January 2026, as well as the development of LNG projects in operation (Ichthys LNG and Gladstone LNG in Australia) and projects under study (such as Papua LNG in Papua New Guinea).

In the Exploration & Production segment:

- most of the organic investments were allocated to the development of new hydrocarbon production facilities, the maintenance of existing facilities, infill well projects for assets already in production as well as exploration activities. Development investments particularly concerned the Ballymore project in the United States, commissioned in April 2025, and Mero 4, which came on stream in May 2025, along with major projects under construction such as Tilenga and Kingfisher in Uganda and the associated cross-border EACOP pipeline project in Uganda/Tanzania, GGIP in Iraq, Sépia 2 and Arapu 2 in Brazil, Kaminho in Angola and GranMorgu in Suriname;
- in Exploration, TotalEnergies pursued its exploration and appraisal program – in which it invests around $1 billion every year, particularly in Namibia, Suriname and Brazil – in order to continue organically feeding its project portfolio;
- in CCS, TotalEnergies invested in partnership in the development of CO_2 storage projects located in the North Sea and in operation (Northern Lights, in Norway), under construction (Northern Endurance in the UK) or under study (such as Aramis in the Netherlands and Bifrost in Denmark);

– in nature-based carbon sink projects, the Company continued its investments, particularly in inclusive forestry and agricultural management projects.

In the Refining & Chemicals segment, organic investments were dedicated on the one hand to safety and maintenance of the installations (including major shutdowns) and to the energy efficiency program and, on the other hand, to the development of new facilities. In particular, they were devoted to the construction, in partnership with the Saudi Arabian Oil Company, of Amiral, a world-scale petrochemical complex in Saudi Arabia, for which the final investment decision was taken in December 2022. They were also dedicated to projects intended to improve plants' competitiveness, particularly in Europe, and to the further development of the project to transform the Grandpuits refinery into a zero-crude platform focusing on new energies and low-carbon activities, which is expected to represent a cumulated investment of more than €500 million by 2026.

In the Marketing & Services segment, organic investments were mainly dedicated to the maintenance of the worldwide network of service stations. TotalEnergies continued to deploy charging infrastructure for electric mobility, mainly in Europe, while reducing its investment in that infrastructure by arranging partnerships and external financing.

Acquisitions in 2025

Acquisitions finalized by TotalEnergies in 2025 amounted to approximately $3.9 billion (compared to $4.6 billion in 2024 and $6.4 billion in 2023).

TotalEnergies continued to develop the Integrated Power segment, in particular by:

– acquiring VSB, a renewables projects developer in Germany, for €1.6 billion;
– acquiring stakes in renewables projects in Canada (solar), Uganda (hydroelectricity) and in the Dominican Republic (solar);

In the Integrated LNG segment, TotalEnergies:

– acquired gas interests in production in the Eagle Ford basin in the United States (Dorado and Constellation);
– acquired stakes from Petronas in multiple blocks located off the coast of Malaysia and a block located off the coast of Indonesia, in order to carry out exploration, appraisal and development programs there.

In Exploration & Production, TotalEnergies:

– acquired an additional 10% stake in the Moho field in Congo, while divesting two mature assets;
– acquired 75% of the Tungsten Explorer drillingship rig as part of a joint venture with Vantage (25%) for $199 million.

Divestments in 2025

TotalEnergies completed asset sales amounting to approximately $3.6 billion in 2025 (compared to $3.2 billion in 2024 and $7.7 billion in 2023). They included in particular:

– in the Integrated Power segment, the implementation of its capital recycling strategy, including the sale of 50% stakes in renewables portfolios (1.4 GW in North America, 604 MW in Portugal, 424 MW in Greece and 270 MW in France) and the sale of a 1.7% stake in listed company Adani Green Energy Limited(1);
– in the Exploration & Production segment, the divestment of interests in two unconventional blocks in Argentina, the non-operated stake in the Bonga field in Nigeria, interests in the Nkossa and Nsoko II licenses in the Republic of the Congo and the non-operated stake in Ekofisk satellite fields in Norway;
– in the Integrated LNG segment, the partial sale of an interest in block SK408 in Malaysia;
– in the Marketing & Services segment, the divestment of fuel distribution activities in Brazil.

After peaking in 2024, net investments thus amounted to $17.1 billion in 2025 (compared to $17.8 billion in 2024 and $16.8 billion in 2023).

1.4.2 Major planned investments

In accordance with its growth strategy in the Integrated Power segment, TotalEnergies plans to continue its development in the electricity value chain. In particular, the Company intends to pursue its investment efforts, notably in solar and wind power projects in the United States and Europe, wind power projects in Brazil in partnership with Casa dos Ventos, and plans to finalize the acquisition of 50% of a portfolio of flexible power generation assets from EPH in 2026.

In the Integrated LNG segment, TotalEnergies plans in particular to continue investments dedicated to major LNG production projects for which the final investment decision has already been taken (mainly Mozambique LNG, North Field East and North Field South in Qatar, Rio Grande LNG in the United States and Marsa LNG in Oman) as well as the development of LNG production projects that are in operation (notably Ichthys LNG and Gladstone LNG in Australia).

In the Exploration & Production segment, investments in the development of oil and gas projects are expected to be dedicated essentially to major development projects under way for which the final investment decision has already been taken (Tilenga and Kingfisher projects in Uganda and the associated EACOP cross-border oil pipeline project in Uganda/Tanzania, GGIP Phase 2 in Iraq, Atapu 2 and Sépia 2 in Brazil, Kaminho in Angola and GranMorgu in Suriname). In addition, TotalEnergies intends to pursue its exploration program, particularly in Namibia with an exploration well expected on PEL83 (Mopane)(2), and short-cycle development projects, particularly in West Africa.

In downstream, investments of the Refining & Chemicals segment are expected to be mainly dedicated, on the one hand, to facility safety and maintenance (including major shutdowns) and the energy efficiency program and, on the other, to the continuation of the project to transform the Grandpuits refinery (France) into a zero-crude platform as well as the construction, in partnership with the Saudi Arabian Oil Company, of Amiral, a world-scale petrochemical complex in Saudi Arabia.

Investments in the Marketing & Services segment are expected to be mainly allocated, on the one hand, to the maintenance of the global network of service stations and, on the other and to a lesser extent, to the development of the European electric mobility network.

1.4.3 Financing mechanisms

TotalEnergies self-finances most of its investments with cash flow from operating activities and may occasionally access the bond market. Certain subsidiaries or specific projects may be financed through external financing, notably in the case of joint-ventures. These include Ichthys LNG in Australia, Satorp in Saudi Arabia, Mozambique LNG in Mozambique, Cameron LNG and Rio Grande LNG in the United States and Hanwha TotalEnergies Petrochemical Co. in South Korea.

(1) TotalEnergies held a 17.25% stake in that company as of December 31, 2025.
(2) The finalisation of the transaction remains subject to the approval of the competent authorities.

1.8 Our financial performance

1.8.1 Overview of the 2025 fiscal year

For the year 2025, the Company reported adjusted net income of $15.6 billion and cash flow of $27.8 billion in an environment marked by a decline of 15% in oil prices. IFRS net income amounted to $13.1 billion, down 17%. Return on average capital employed stood at 12.6%, the best among the majors for the fourth consecutive year. TotalEnergies continued to implement its balanced, disciplined growth strategy by investing $17.1 billion in 2025, including 37% for new oil & gas projects and around $3.5 billion in low-carbon energies, of which nearly $3 billion in electricity. TotalEnergies ended 2025 with a gearing ratio(1) at 15%, highlighting the Company's solid financial position.

For the year 2025, Exploration & Production generated adjusted net operating income of $8.4 billion and cash flow of $15.6 billion. In 2025, TotalEnergies' production growth benefited from the start-up and ramp-up of seven major projects (Mero-2, Mero-3 and Mero-4 in Brazil, Anchor and Ballymore in the United States, Fenix in Argentina and Tyra in Denmark). Accretive upstream production growth helped offset $5/b of the $11/b price decline recorded over the year. The Company maintained operating costs at $5/b in 2025 and continued to reduce operated methane emissions by over 20% during the year.

With a reserve replacement rate of 116% in 2025, TotalEnergies maintains proven reserves life above 12 years, while continuing to build its future project portfolio. The Company signed an agreement with Galp to acquire a 40% operated interest in the prolific PEL83 license, which includes the Mopane discovery. It also expanded its exploration portfolio by entering new licenses in Algeria, the United States, Nigeria, Malaysia, Indonesia, Guyana and Liberia. TotalEnergies pursued active management of its upstream portfolio, notably signing an agreement to merge its mature UK North Sea assets with NEO NEXT and selling interests in non-operated projects in Nigeria and Brazil.

For full-year 2025, Integrated LNG generated adjusted net operating income of $4.1 billion and cash flow of $4.7 billion. The Company continued to strengthen its integration along the US LNG value chain with the investment decision for Train 4 of the Rio Grande LNG project, including the purchase of 1.5 Mt/y of LNG and the acquisition of new upstream gas interests in the Anadarko Basin.

For 2025, cash flow amounted to $2.6 billion, in line with the announced target. Return on average capital employed stood at 10%. Net electricity production reached 48 TWh, up 17% year-on-year, helping reduce the average carbon intensity of all energy products sold to customers (-18.5% versus 2015). To accelerate its gas-to-power integration strategy in Europe, TotalEnergies signed an agreement with EPH to acquire 50% of a portfolio of flexible power generation assets with more than 14 GW of gross capacity. In 2025, TotalEnergies also recycled $2 billion of capital by selling 50% of a 2.7 GW gross capacity portfolio (United States, Portugal, Greece, France), in line with its renewables business model.

For 2025, Downstream adjusted net operating income reached $3.8 billion and cash flow $6.2 billion, with Refining & Chemicals capturing the margin improvement in the second half of the year and Marketing & Services benefiting from continued increases in unit margins.

Given the Company's strong cash-flow generation and solid balance sheet despite uncertain environment, the Board of Directors will propose to the Annual Shareholders' Meeting on May 29, 2026, the distribution of a final 2025 dividend of €0.85/share, bringing the full-year 2025 dividend to €3.40/share, up 5.6% from the 2024 dividend, reflecting the share buybacks executed in 2025 ($7.5 billion for a 55% payout). The Board also confirmed the 2026 share-buyback guidance of $3 billion to $6 billion for an oil price between $60 and $70/b and an exchange rate around $1.20/€. Considering the uncertain price environment, it authorized $750 million of buybacks in the first quarter 2026, consistent with the budget assumption ($60/b), thereby preserving the flexibility to adjust the level of buybacks during 2026 depending on price developments.

Acquisitions net of assets sales[a]	279	1,406	(1,289)
Net investments[a]	17,091	17,829	16,837
Cash flow from operations excluding working capital (CFFO)[a]	27,839	29,917	35,946
Debt adjusted cash flow (DACF)[a]	29,255	30,614	36,451
Cash flow from operating activities	27,343	30,854	40,679

(a) Refer to the glossary for definitions and additional information on alternative performance measures (APM, Non-GAAP measures) and to point 1.8 for reconciliation tables.
(b) Effective tax rate = (tax on adjusted net operating income)/(adjusted net operating income – income from equity affiliates – dividends received from investments – impairment of goodwill + tax on adjusted net operating income).
(c) In accordance with IFRS rules, adjusted fully diluted earnings per share is calculated from the adjusted net income less the interest on the perpetual subordinated bonds.
(d) Average €-$ exchange rate: 1.1300 for 2025.

1.8.1.2 Environment - liquids and gas price realizations, refining margins

	2025	2024	2023
Brent *($/b)*	69.1	80.8	82.6
Henry Hub *($/Mbtu)*[a]	3.6	2.4	2.7
TTF *($/Mbtu)*[b]	12.0	11.0	13.1
JKM *($/Mbtu)*[c]	12.2	11.9	13.8
Average price of liquids *($/b)*[d][e] Consolidated subsidiaries	66.2	77.1	76.2
Average price of gas *($/Mbtu)*[d][e] Consolidated subsidiaries	5.72	5.54	6.64
Average price of LNG *($/Mbtu)*[d][f] Consolidated subsidiaries and equity affiliates	9.14	9.80	10.76
European Refining Margin Marker (ERM) *($/b)*[d][g]	7.1	5.3	9.5

(a) HH (Henry Hub), a pipeline located in Erath, Louisiana, USA, serves as the official delivery point for New York Mercantile Exchange (NYMEX) futures contracts. It is widely used as a price reference for natural gas markets in North America. The hub is operated by Sabine Pipe Line LLC and is connected to four intrastate and nine interstate pipelines, including the Transcontinental, Acadian and Sabine pipelines.
(b) TTF (Title Transfer Facility) is a virtual trading point in the Netherlands for transferring rights in respect of physical gas. It is the most liquid and widely used price benchmark for the natural gas markets in Europe. TTF is operated by Gasunie Transport Services (GTS), the owner and operator of the national transmission network in the Netherlands. It is traded in €/MWh.
(c) JKM (Japan-Korea Marker) measures spot LNG trading prices in Asia. It is based on the prices reported in spot market trades and/or bids and offers of LNG collected after the close of the Asian trading day at 16:30 Singapore time.
(d) Does not include oil, gas and LNG trading activities, respectively.
(e) Sales in $/Sales in volume for consolidated affiliates.
(f) Sales in $/Sales in volume for consolidated and equity affiliates.
(g) This market indicator for European refining, calculated based on public market prices ($/b), uses a basket of crudes, petroleum product yields and variable costs representative of the European refining system of TotalEnergies. Since the results for the fourth quarter of 2025, it has been expressed in ($/b), with a conversion factor of 7.5 b/t. The ERM stood at $71.0/t in 2023, $39.5/t in 2024 and $53.4/t in 2025.

(1) Refer to the glossary for definitions and additional information on alternative performance measures (APM, Non-GAAP measures) and to point 1.8 for reconciliation tables.

1.8.1.3 Production

Hydrocarbon production[a]	2025	2024	2023
Hydrocarbon production (*kboe/d*)	2,529	2,434	2,483
Oil (including bitumen) (kb/d)	*1,378*	*1,314*	*1,388*
Gas (including Condensates and associated NGL) (kboe/d)	*1,151*	*1,120*	*1,095*
Hydrocarbon production (*kboe/d*)	2,529	2,434	2,483
Liquids (kb/d)	*1,533*	*1,468*	*1,550*
Gas (Mcf/d)	*5,402*	*5,211*	*5,028*

(a) Company production = E&P production + Integrated LNG production.

Hydrocarbon production averaged 2,529 thousand barrels of oil equivalent per day in 2025, up nearly 4% year-on-year, due to the following factors:

- +6% from project start-ups and ramp-ups, notably Mero-2, Mero-3 and Mero-4 in Brazil, Anchor and Ballymore in the United States, Fenix in Argentina, and Tyra in Denmark;
- +1% scope effect, mainly linked to the acquisitions of SapuraOMV in Malaysia and interests in gas licenses in the Eagle Ford basin in Texas;
- -3% due to the natural decline of fields.

1.8.1.4 Analysis of business segments

Exploration & Production

Hydrocarbon production	2025	2024	2023
EP *(kboe/d)*	1,990	1,947	2,034
Liquids (kb/d)	*1,467*	*1,408*	*1,492*
Gas (Mcf/d)	*2,794*	*2,880*	*2,900*

Results *(in M$ except the effective tax rate)*	2025	2024	2023
Adjusted net operating income	8,399	10,004	10,942
including adjusted income from equity affiliates	*714*	*742*	*539*
Effective tax rate[a]	49.9%	47.8%	50.0%
Organic investments[b]	9,564	9,060	10,232
Acquisitions net of cessions[b]	(305)	(207)	(2,706)
Net investments[b]	9,259	8,853	7,526
Cash flow from operations excluding working capital (CFFO)[b]	15,646	17,049	19,126
Cash flow from operating activities	14,949	17,388	18,531

(a) Effective tax rate = (tax on adjusted net operating income)/(adjusted net operating income – income from equity affiliates – dividends received from investments – impairment of goodwill + tax on adjusted net operating income).
(b) Refer to the glossary for definitions and additional information on alternative performance measures (APM, Non-GAAP measures) and to point 1.8 for reconciliation tables.

For full-year 2025, Exploration & Production cash flow from operations excluding working capital (CFFO) amounted to $15,646 million, benefiting from accretive production growth that offset the impact of a $5/b decline in Brent, resulting in a year-on-year decrease of only 8%.

Integrated LNG

Hydrocarbon production for LNG	2025	2024	2023
Integrated LNG *(kboe/d)*	539	487	449
Liquids (kb/d)	*66*	*60*	*58*
Gas (Mcf/d)	*2,608*	*2,331*	*2,128*

Liquefied Natural Gas *(in Mt)*	2025	2024	2023
Overall LNG sales	43.9	39.8	44.3
*incl. Sales from equity production**	*15.1*	*15.5*	*15.2*
incl. Sales by TotalEnergies from equity production and third party purchases	*38.8*	*34.7*	*40.1*

* The Company's equity production may be sold by TotalEnergies or by the joint-ventures.

Results *(in M$)*	2025	2024	2023
Average price of LNG ($/Mbtu)* Consolidated subsidiaries and equity affiliates	9.14	9.80	10.76
Adjusted net operating income	4,109	4,869	6,200
including adjusted income from equity affiliates	*1,865*	*1,978*	*2,103*
Organic investments[a]	2,569	2,169	2,063
Acquisitions net of assets sales[a]	165	1,367	1,096
Net investments[a]	2,734	3,536	3,159
Cash flow from operations excluding working capital (CFFO)[a]	4,698	4,903	7,293
Cash flow from operating activities	5,173	5,185	8,442

* Sales in $/Sales in volume for consolidated and equity affiliates. Does not include LNG trading activities.
(a) Refer to the glossary for definitions and additional information on alternative performance measures (APM, Non-GAAP measures) and to point 1.8 for reconciliation tables.

For full-year 2025, Integrated LNG cash flow from operations excluding working capital (CFFO) amounted to $4.7 billion, supported by 10% growth in production and sales in an environment of low volatility and declining average price of LNG.

Integrated Power

	2025	2024	2023
Net power production *(TWh)*[a]	**48.1**	**41.1**	**33.4**
of which power production from renewables	*31.4*	*26.0*	*18.9*
of which power production from gas flexible capacities	*16.7*	*15.1*	*14.5*

Clients power - BtB and BtC *(Million)*[b]	6.0	6.1	5.9
Clients gas - BtB and BtC *(Million)*[b]	2.7	2.8	2.8
Sales power - BtB and BtC *(TWh)*	48.8	50.7	52.1
Sales gas - BtB and BtC *(TWh)*	89.2	98.6	100.9

(a) Solar, wind, hydroelectric and gas flexible capacities.
(b) End of period data.
(c) Includes 17.25% of Adani Green Energy Ltd's gross capacity, 50% of Clearway Energy Group's gross capacity and 49% of Casa dos Ventos' gross capacity.

Gross installed renewable power generation capacity reached 34.1 GW at the end of 2025, representing more than 8 GW of additional capacity year-on-year.

Results *(in M$)*	2025	2024	2023
Adjusted net operating income	2,215	2,173	1,853
including adjusted income from equity affiliates	*211*	*–*	*137*
Organic investments[a]	2,187	2,355	2,582
Acquisitions net of assets sales[a]	589	1,514	2,363
Net investments[a]	2,776	3,869	4,945
Cash flow from operations excluding working capital (CFFO)[a]	2,558	2,555	2,152
Cash flow from operating activities	2,374	2,972	3,573

(a) Refer to the glossary for definitions and additional information on alternative performance measures (APM, Non-GAAP measures) and to point 1.8 for reconciliation tables.

For full-year 2025, Integrated Power cash flow from operations excluding working capital (CFFO) amounted to $2.6 billion, in line with annual guidance. Production activities (including renewables and gas-fired power plants) accounted for 55% and marketing activities (B2B, B2C and trading) accounted for 45%.

Downstream (Refining & Chemicals and Marketing & Services)

Results *(in M$)*	2025	2024	2023
Adjusted net operating income	3,751	3,520	6,112
Organic investments[(a)]	2,239	2,662	3,105
Acquisitions net of assets sales[(a)]	(193)	(1,262)	(2,042)
Net investments[(a)]	2,046	1,400	1,063
Cash flow from operations excluding working capital (CFFO)[(a)]	6,223	6,079	8,171
Cash flow from operating activities	6,294	6,709	9,914

(a) Refer to the glossary for definitions and additional information on alternative performance measures (APM, Non-GAAP measures) and to point 1.8 for reconciliation tables.

Refining & Chemicals

Refinery throughput and utilization rate	2025	2024	2023[(a)]
Total refinery throughput *(kb/d)*	1,526	1,472	1,436
France	*470*	*422*	*414*
Rest of Europe	*606*	*605*	*592*
Rest of world	*449*	*446*	*431*
Utilization rate based on crude only[(b)]	86%	83%	81%

(a) Includes refineries in Africa that are reported in the Marketing & Services segment for 2023.
(b) Based on distillation capacity at the beginning of the year, excluding the African refinery SIR (divested) from 3rd quarter 2024 and the African refinery Natref (divested) during the 4th quarter 2024.

Petrochemicals production and utilization rate	2025	2024	2023
Monomers[(a)] *(kt)*	4,967	5,082	4,896
Polymers (*kt*)	4,658	4,433	4,130
Steam crackers utilization rate[(b)]	79%	79%	69%

a) Olefins.
b) Based on olefins production from steam crackers and their treatment capacity at the start of the year, excluding Lavera (divested) from 2nd quarter 2024.

Refining throughput increased by 4% for the full year 2025, driven by high unit availability in the second half of the year.

Results *(in M$)*	2025	2024	2023
European Refining Margin Market (ERM) ($/b)*	7.1	5.3	9.5
Adjusted net operating income	2,378	2,160	4,654
Organic investments[(a)]	1,464	1,711	2,040
Acquisitions net of assets sales[(a)]	(27)	(173)	(118)
Net investments[(a)]	1,437	1,538	1,922
Cash flow from operations excluding working capital (CFFO)[(a)]	3,798	3,760	5,853
Cash flow from operating activities	3,459	3,808	7,957

* This market indicator for European refining, calculated based on public market prices ($/b), uses a basket of crudes, petroleum product yields and variable costs representative of the European refining system of TotalEnergies. Does not include oil trading activities.
(a) Refer to the glossary for definitions and additional information on alternative performance measures (APM, Non-GAAP measures) and to point 1.8 for reconciliation tables.

For the full year 2025, Refining & Chemicals adjusted net operating income and cash flow from operations excluding working capital (CFFO) amounted to $2,378 million and $3,798 million, respectively, with higher refining margins offsetting the decline in petrochemical margins.

Marketing & Services

Sales *(in kb/d)**	2025	2024	2023
Total Marketing & Services sales	1,276	1,342	1,375
Europe	*743*	*752*	*776*
Rest of world	*533*	*591*	*599*

* Excludes trading and bulk refining sales.

Sales of petroleum products were down by 5% in full-year 2025 as a result of focusing the portfolio on higher margin activities.

Results *(in M$)*	2025	2024	2023
Adjusted net operating income	1,373	1,360	1,458
Organic investments[a]	775	951	1,065
Acquisitions net of assets sales[a]	(166)	(1,089)	(1,924)
Net investments[a]	609	(138)	(859)
Cash flow from operations excluding working capital (CFFO)[a]	2,425	2,319	2,318
Cash flow from operating activities	2,835	2,901	1,957

(a) Refer to the glossary for definitions and additional information on alternative performance measures (APM, Non-GAAP measures) and to point 1.8 for reconciliation tables.

For the full year 2025, Marketing & Services adjusted net operating income was stable and cash flow from operations excluding working capital (CFFO) amounted to $2,425 million, up 5%, with the improvement in unit margins more than offsetting a 5% decline in volumes.

1.8.1.5 TotalEnergies' Results

A. Adjusted net operating income from the business segments

Adjusted net operating income from the business segments amounted to $18,474 million for full-year 2025, compared with $20,566 million in 2024 as accretive hydrocarbon production growth and resilient performance from the Integrated Power segment partially offset the more than $10/b drop in oil prices.

B. Adjusted net income[1] (TotalEnergies share)

Adjusted net income (TotalEnergies share) was $15,587 million in 2025 compared to $18,264 million in 2024.

Adjusted net income excludes the after-tax inventory effect, non-recurring items, and fair-value changes.

TotalEnergies' average tax rate was 39.8% for full-year 2025 compared with 39.4% in 2024.

C. Adjusted earnings (TotalEnergies share) per share

Diluted adjusted net income per share amounted to $6.89 for full-year 2025, calculated based on a weighted-average diluted number of shares of 2,214 million, compared with $7.77 in 2024.

As of December 31, 2025, the diluted number of shares was 2,167 million.

TotalEnergies carried out share buybacks[2] of 122.6 million shares for full-year 2025, for a total amount of $7.5 billion.

D. Acquisitions – asset sales

Completed acquisitions were $3,923 million in 2025, mainly related to the acquisition of interests in 12 offshore blocks in Malaysia, as well as the completion of the VSB acquisition, various renewable projects to be developed in Canada, the Dominican Republic and Uganda for approximately $500 million, and an additional 10% stake in the Moho field in the Republic of the Congo.

Completed divestments were $3,644 million in 2025 mainly reflecting the divestment of the non-operated interest in the Bonga field in Nigeria, the partial sale of an interest in Block SK408 in Malaysia, the sale of 50% stakes in renewable portfolios in the United States and Greece, and the sale of a 1.7% stake in Adani Green Energy, as well as related to the divestment of interests in two unconventional blocks in Argentina, the sale of interests in the Nkossa and Nsoko II licenses in the Republic of the Congo, the sale of 50% of a renewable asset portfolio in Portugal and France, and the divestment of fuel distribution activities in Brazil.

E. Net cash flow[3]

TotalEnergies' net cash flow amounted to $10,748 million for full-year 2025, compared with $12,088 million in 2024, reflecting a $2,078 million decrease in cash flow from operations excluding working capital (CFFO) and a $738 million decrease in net investments, which stood at $17,091 million for the year.

F. Profitability

Return on equity was 13.6% for full-year 2025.

(in M$)	January 1, 2025 to December 31, 2025	January 1, 2024 to December 31, 2024
Adjusted net income[a]	15,833	18,586
Average adjusted shareholders' equity	116,827	117,835
Return on equity (ROE)	**13.6%**	**15.8%**

1.8.1.6 TotalEnergies SE statutory accounts

Net income for TotalEnergies SE, the parent company, amounted to €13,721 million in 2025, compared to €15,275 million in 2024.

(1) Refer to the glossary for definitions and additional information on alternative performance measures (APM, Non-GAAP measures) and to point 1.8 for reconciliation tables.
(2) Net of fees and taxes, including coverage of employees share grant plans.
(3) Refer to the glossary for definitions and additional information on alternative performance measures (APM, Non-GAAP measures) and to point 1.8 for reconciliation tables.

1.8.1.7 Shareholder return policy and proposed dividends

The shareholder return policy of the Company combine dividends and share buybacks, the levels of which are determined according to the following cash flow allocation priorities:

- a sustainable ordinary dividend across cycles, which did not decrease during the Covid crisis and whose increase is supported by free cash flow growth;
- disciplined investments in support of a balanced strategy anchored in two pillars: oil and gas on the one hand, and low-carbon activities, mainly electricity, on the other;
- maintaining a strong balance sheet;
- share buybacks to share the excess cash flow generated at high prices.

The rate of return to shareholders is calculated on the basis of the amount of dividends paid during the year, plus the amount of TotalEnergies share buybacks in view of their cancellation carried out by the Corporation during the year, divided by the cash flow from operations excluding working capital (CFFO)[1] for the fiscal year in question.

Shareholder return for 2025

Following its meeting on September 24, 2025, thanks to the disciplined investment policy as well as anticipated free cash flow[2] growth of around $10 billion by 2030 (compared to 2024 in the same price environment), the Board of Directors reaffirmed the priority given to dividend and its growth through cycles and confirmed a shareholder return policy of more than 40% of annual cash flow regardless of energy prices. On September 24, the Board of Directors also authorized $1.5 billion of share buybacks in the fourth quarter 2025, resulting in $7.5 billion of share buybacks for the full year 2025. In addition, the Board of Directors approved 2026 share buyback guidance of between $0.75 billion and $1.5 billion per quarter for a Brent price between $60 and $70/b and an exchange rate of around 1.20 $/€.

The Board of Directors met on February 10, 2026, after having closed the statutory accounts for fiscal year 2025, decided to propose at the Shareholders' Meeting to be held on May 29, 2026, the dividend distribution of €3.40/share for fiscal year 2025, a 5.6% increase compared to the dividend for fiscal year 2024 of €3.22/share. The final dividend for fiscal year 2025 thus set at €0.85/share, identical to the three interim dividends for fiscal year 2025 previously decided by the Board of Directors.

The payout (rate of return to shareholders) for fiscal year 2025 was 55%[3].

Shareholder return for 2026

Under a scenario of $60/b Brent, $10/MBtu TTF and $5/b ERM, the Company expects to generate cash flow above $26 billion, supported by accretive production growth, improved Downstream performance and growth in Integrated Power.

Given the Company's strong cash-flow generation and solid balance sheet despite uncertain environment, the Board of Directors, at its meeting on February 10, 2026, confirmed the 2026 share-buyback guidance of $3 billion to $6 billion for an oil price between $60 and $70/b and an exchange rate around 1.20 $/€.

The Company should maintain an attractive shareholder return while preserving the strength of its balance sheet, with a targeted gearing ratio[4] of around 15% at end-2026. Considering the uncertain price environment, it authorized $750 million of buybacks in the first quarter 2026, consistent with the budget assumption ($60/b), thereby preserving the flexibility to adjust the level of buybacks during 2026 depending on price developments.

1.8.1.8 Annual 2026 Sensitivities*

	Change	Estimated impact on adjusted net operating income	Estimated impact on cash flow from operations excluding working capital (CFFO)
Dollar	+/- $0.1 per €	-/+ $0.1 B	~ $0 B
Average liquids sales price**	+/- $10/b	+/- $2.3 B	+/- $2.8 B
European gas price - TTF	+/- $2/Mbtu	+/- $0.4 B	+/- $0.4 B
European Refining Margin Marker (ERM)	+/- $1/b	+/- $0.3 B	+/- $0.4 B

* Sensitivities are revised once per year upon publication of the previous year's fourth quarter results. Sensitivities are estimates based on assumptions about TotalEnergies' portfolio in 2026. Actual results could vary significantly from estimates based on the application of these sensitivities. The impact of the $-€ sensitivity on adjusted net operating income is essentially attributable to Refining & Chemicals.
** In a $60-70/b Brent environment.

1.8.1.9 Alternative Performance Measures (Non-GAAP measures)

A. Adjustment items to net income (TotalEnergies share)

(M$)	2025	2024	2023
Net income (TotalEnergies share)	**13,127**	**15,758**	**21,384**
Special items affecting net income (TotalEnergies share)	(1,185)	(1,219)	(1,105)
Gain (loss) on asset sales	487	1,372	2,047
Restructuring charges	(58)	(27)	(56)
Impairments	(1,156)	(1,976)	(2,166)
Other	(458)	(588)	(930)
After-tax inventory effect: FIFO vs. replacement cost	(610)	(339)	(699)
Effect of changes in fair value	(665)	(948)	12
Total adjustments affecting net income	**(2,460)**	**(2,506)**	**(1,792)**
Adjusted net income (TotalEnergies share)	**15,587**	**18,264**	**23,176**

TotalEnergies SE has committed credit facilities granted by international banks enabling it to benefit from significant liquidity reserves. As of December 31, 2025, these credit facilities amounted to $19,767 million (compared to $10,353 million as of December 31, 2024), of which $19,767 million was unutilized (compared to $10,353 million unutilized as of December 31, 2024).

The agreements underpinning credit facilities granted to TotalEnergies SE do not contain conditions related to the Corporation's financial ratios, to its credit ratings from specialized agencies, or to the occurrence of events that could have a material adverse effect on its financial position.

Credit facilities granted to the companies of the Company other than TotalEnergies SE are not intended to fund the Company's general corporate purposes; they are intended to fund either general corporate purposes of the borrowing affiliate, or a specific project.

Anticipated sources of financing

Investments, working capital, dividend payments and buybacks of its own shares by the Corporation are financed by cash flow from operating activities, asset disposals and, if necessary, by net borrowings.

For the coming years and based on the current financing conditions available in the financial markets, the Corporation intends to maintain this policy.

1.8.3 Trends and outlook

Outlook

At the beginning of 2026, oil markets remain volatile in a constantly evolving geopolitical environment. Fundamentals, however, remain unchanged: global demand is expected to grow by around 0.9 million barrels per day (IEA – January 2026), driven by activity in non-OECD countries and by petrochemical demand; at the same time, non-OPEC supply growth is slowing, while OPEC+ has decided to maintain its quota policy at the beginning of 2026.

European gas prices for the first quarter on forward markets are hovering around $11-12/MBtu, reflecting strong winter consumption and storage levels below the seasonal averages observed since 2022.

In 2026, the Company intends to continue implementing its balanced and profitable transition strategy, anchored on its two growth pillars: hydrocarbons and electricity.

The Company plans to increase its overall energy production (oil, gas and electricity) by 5% over the year while continuing to reduce emissions from its operations, with a target of achieving a 70% reduction in methane emissions in 2026 compared with 2020.

For its first growth pillar, TotalEnergies expects to increase its oil and gas production by 3% in 2026, supported by the ramp-up of projects started in 2025, the anticipated start-ups in 2026 (notably Lapa in Brazil, Ratawi in Iraq, North Field East in Qatar, TFT II & South in Algeria, Tilenga in Uganda). These new barrels support a 7% increase in cash flow at $60/b, higher than production growth. The Company intends to maintain its competitive advantage by keeping production costs below $5/b through strong operational discipline. In the first quarter of 2026, hydrocarbon production is expected to be above 2.6 Mboe/d.

At the start of the year, refining margins are hovering around $5/b in a context of volatile crude prices. The Company expects to benefit from the improved availability of certain units that underperformed in 2025 and therefore anticipates an increase in refinery utilization rates to around 88% in the first quarter of 2026, in the absence of major shutdowns.

Integrated LNG is expected to continue its growth in 2026 with the start-up of the North Field East project in Qatar (2 Mtpa of offtake) and Costa Azul on the North American Pacific coast (1.7 Mtpa of offtake). This growth, combined with LNG sales of over 44 Mt in 2026, should offset the expected decline in LNG prices and enable the segment to generate, at $60/b (Brent) and $10/MBtu (TTF), cash flow equivalent to that generated in 2025. Given recent oil and gas price trends and the lag effect on pricing formulas, TotalEnergies anticipates an average LNG sales price close to $8.5/MBtu in the first quarter of 2026.

For its second growth pillar, TotalEnergies plans to increase its electricity production by around 25% in 2026 to exceed 60 TWh, considering in particular the completion of the EPH acquisition, expected mid-2026, which will enable the Company to accelerate its gas-to-power integration strategy in Europe. For the year, Integrated Power cash flow is expected to exceed $3 billion for investments of $2.5-3 billion.

In 2026, TotalEnergies expects net investments of around $15 billion, including about $3 billion dedicated to low-carbon energies, mainly electricity. Reintegrating the annual equivalent of more than $1 billion over five years linked to the acquisition of EPH's flexible power assets in shares, the planned investment effort in low-carbon energies thus amounts to around $4 billion in 2026. The Company is implementing its multi-year cash-savings plan (Capex + Opex), now targeting $12.5 billion over 2026–2030, including $2.5 billion planned for 2026.

Under a scenario of $60/b Brent, $10/MBtu TTF and $5/b ERM, the Company expects to generate cash flow above $26 billion, supported by accretive production growth, improved Downstream performance and growth in Integrated Power. In this environment, the Company should maintain an attractive shareholder return while preserving the strength of its balance sheet, with a targeted gearing ratio of around 15% at end-2026. Based on the seasonality observed in recent years, a temporary increase of around $2-3 billion in working capital requirements is expected in the first quarter of 2026.

Risks and uncertainties

Due to the nature of its business, the Company's activities remain subject to the market risks (sensitivity to the environmental parameters of the oil and financial markets), industrial and environmental risks related to its operations, and to political or geopolitical risks stemming from the global presence of most of its activities.

Detailed information is given in the Risk Factors section (point 3.1 of chapter 3) of this Universal Registration Document. For more information on internal control and risk management procedures, also refer to point 3.3 of chapter 3.

2.1 Upstream oil and gas activities

TotalEnergies' Upstream oil and gas activities encompass the oil and gas exploration and production activities of the Exploration & Production (E&P) and Integrated LNG segments. They are conducted in about 50 countries.

Main indicators

2.53 Mboe/d
of hydrocarbons produced in 2025

11.2 Gboe
of proved reserves of hydrocarbons as of December 31, 2025[c]

>12 years of proved reserve life index

Main objectives

~+3% per year between 2024-2030
Production growth

+3% in 2026

<$5/boe
Production costs (ASC932)[a]

-80%
methane emissions from operated facilities in 2030 or sooner compared to 2020

(a) Production costs for the consolidated subsidiaries, calculated in accordance with ASC 932 standards, excluding special items (refer to point 9.1.5 of chapter 9).
(b) Excluding LNG assets. The GHG emissions intensity of Upstream oil & gas activities is reported on the assets perimeter operated by the Company.
(c) Based on a Brent price of $69.51/b (reference price in 2025) in accordance with the rules established by the Securities and Exchange Commission (refer to point 2.1.1).

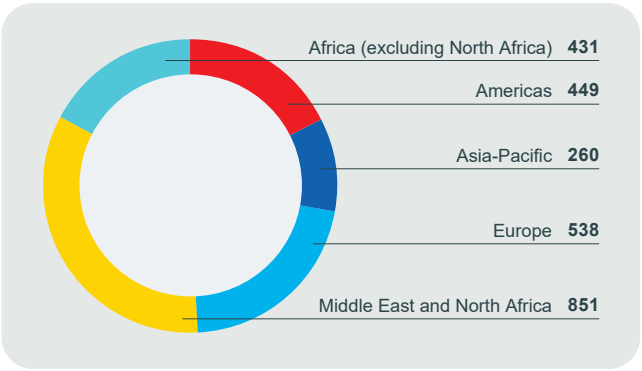

Production[a]

Hydrocarbon production	2025	2024	2023
Combined production *(kboe/d)*	2,529	2,434	2,483
Oil (including bitumen) *(kb/d)*	1,378	1,314	1,388
Gas (including condensates and associated NGL) *(kboe/d)*	1,151	1,120	1,095

Hydrocarbon production	2025	2024	2023
Combined production *(kboe/d)*	2,529	2,434	2,483
Liquids *(kb/d)*	1,533	1,468	1,550
Gas *(Mcf/d)*	5,402	5,211	5,028

(a) TotalEnergies production = E&P production + production of Integrated LNG.

Hydrocarbon production by geographical zone in 2025 *(kboe/d)*

Hydrocarbon production was 2,529 thousand barrels of oil equivalent per day in 2025, up nearly 4% year-on-year and was comprised of:

- +6% from the start-up and ramp-up of projects, notably Mero-2, Mero-3 and Mero-4 in Brazil, Anchor and Ballymore in the United States, Fenix in Argentina, and Tyra in Denmark,
- +1% scope effect, mainly linked to the acquisitions of SapuraOMV in Malaysia and interests in gas licenses in the Eagle Ford basin in Texas,
- -3% due to the natural field declines.

Technical costs[a]

	2025	2024	2023
Production costs *($/boe)*	5.0	4.9	5.5
Exploration costs *($/boe)*	0.5	0.7	0.7

Hydrocarbon reserves *(Mboe)*	11,218	11,073	10,564
Oil (including bitumen) *(Mb)*	5,451	5,227	4,731
Gas (including Condensates and associated NGL) *(Mboe)*	5,767	5,846	5,833

As of December 31	2025	2024	2023
Hydrocarbon reserves *(Mboe)*	11,218	11,073	10,564
Liquids *(Mb)*	6,164	5,980	5,487
Gas *(Bcf)*	27,481	27,626	27,517

Hydrocarbon proved reserves by geographical zone as of December 31, 2025 *(in Mboe)*

Proved reserves of hydrocarbons established under the SEC rules (Brent at $69.51/b in 2025) were 11,218 Mboe as of December 31, 2025. The proved reserve replacement rate[2], based on SEC rules (Brent at $69.51/b in 2025), was +116% in 2025 and +138% over three years.

2.1.1 Oil and gas reserves

The definitions used for proved, proved developed and proved undeveloped crude oil and natural gas reserves are in accordance with the United States Securities & Exchange Commission (SEC) Rule 4-10 of Regulation S-X as amended by the SEC Modernization of Oil and Gas Reporting release issued on December 31, 2008. Proved reserves are estimated using geological and engineering data to determine with reasonable certainty whether the crude oil or natural gas in known reservoirs is economically producible under existing regulatory, economic and operating conditions.

TotalEnergies' oil and natural gas reserves are consolidated annually, taking into account among other factors, levels of production, field reassessments, additional reserves from discoveries and extensions, disposals and acquisitions of reserves and other economic factors.

Unless otherwise indicated, any reference to TotalEnergies' proved reserves, proved developed reserves, proved undeveloped reserves and production reflects the TotalEnergies' entire share of such reserves or such production. TotalEnergies' worldwide proved reserves include the proved reserves of its consolidated entities as well as its proportionate share of the proved reserves of equity affiliates. The reserves estimation process involves making subjective judgments. Consequently, estimates of reserves are not exact measurements and are subject to revision under well-established control procedures.

The reserves booking process requires, among other actions:

– that an internal peer review of technical evaluations is carried out, allowing moreover, to ensure that the SEC definitions and guidance are followed; and

(1) FASB Accounting Standards Codification 932, Extractive industries – Oil and Gas.
(2) Variation of reserves, excluding production: (revisions + discoveries & extensions + acquisitions - disposals)/production for the period.

– that prior to booking proved reserves, management makes the necessary funding commitments required for their development.

For further information concerning the reserves and their evaluation process, refer to points 9.1 and 9.2 of chapter 9.

Proved reserves for 2025, 2024 and 2023

In accordance with the amended Rule 4-10 of SEC Regulation S-X, proved reserves as of December 31 are calculated using a 12-month average price determined as the unweighted arithmetic average of the first-day-of-the-month price for each month of the relevant year, unless prices are defined by contractual arrangements, excluding escalations based upon future conditions. The average reference prices for Brent crude for 2025, 2024 and 2023 were, respectively, $69.51/b, $81.17/b, and $83.27/b.

As of December 31, 2025, TotalEnergies' combined proved reserves of oil and gas were 11,218 Mboe (of which 7,054 Mboe were proved developed reserves) compared to 11,073 Mboe (of which 6,965 Mboe were proved developed reserves) as of December 31, 2024. As of December 31, 2025, the reserves were located in Africa (mainly in Nigeria, Angola, Mozambique and Uganda), the Americas (mainly in Brazil, United States and Argentina), Asia-Pacific (mainly in Australia, Kazakhstan), Europe (mainly in Norway and Denmark) and the Middle East and North Africa (mainly in the United Arab Emirates, Qatar, Yemen, Iraq, Libya, Oman and Algeria).

Natural gas and related products (condensates and natural gas liquids) represent approximately 51% of these reserves, and crude oil 49%.

Discoveries of new fields and extensions of existing fields added 692 Mboe to TotalEnergies' proved reserves during the three years 2023, 2024 and 2025 (before deducting production and sales of reserves and without adding any reserves acquired during this period). The revisions over the same period are +2,346 Mboe, mainly due to field performance, improved recovery projects and to the net impact of changes in hydrocarbon prices in 2023 (decrease), in 2024 (decrease) and in 2025 (decrease).

Reserve sensitivity to oil and gas prices

Changes in the price used as a reference for the proved reserves estimation result in non-proportionate inverse changes in proved reserves associated with production sharing and risked service contracts (which together represent approximately 30% of TotalEnergies' proved reserves as of December 31, 2025). Under such contracts, TotalEnergies is entitled to a portion of the production, the sale of which is meant to cover expenses incurred by TotalEnergies. The greater the oil prices decrease, the greater the number of barrels necessary to cover the same amount of expenses. In addition, the number of barrels economically producible under these contracts may vary according to criteria such as cumulative production, the rate of return on investment or the income-cumulative expenses ratio. This increase in reserves is partly offset by a reduction of the duration over which fields are economically producible. However, the effect of a reduction in the duration of production is usually inferior to the impact of the drop in prices in production sharing contracts or risked service contracts and consequently lower prices usually lead to an increase in TotalEnergies' reserves, and vice versa.

Finally, for any type of contract, a significant decrease in the reference price of petroleum products that negatively impacts projects' profitability may lead to a reduction in proved reserves, and vice versa.

2.1.2 Exploration

TotalEnergies evaluates exploration opportunities based on a variety of geological, technical, political, economic (including tax and contractual terms), environmental and societal factors.

In line with the Company's strategy, TotalEnergies has increased the selectivity of its exploration investments with a greater focus on oil prospects with low technical costs, low GHG emissions and which can be put into production quickly, and on gas prospects, in areas where they can provide feedstock to existing LNG infrastructure and future LNG projects. In addition to these criteria, the Company ensures to balance its exploration investments between mature regions (35%; with a relatively low level of geological risk, situated near existing producing fields and infrastructure), emerging regions (50%; in under-explored areas but where the presence of hydrocarbons is already proven), and in frontier basins (15%; where there is a chance of making major resources discoveries).

This approach has led to numerous significant discoveries since 2022, notably in Suriname (discovery of Sapakara and Krabdagu on Block 58, 50%, GranMorgu project under development), in Cyprus (discovery of Cronos on Block 6, 50%) and in Namibia (discovery of Venus on Block PEL56 (formely block 2913B), 45.25%). Discoveries were made near existing infrastructure in Nigeria in 2023 (discovery of Ntokon on license OML102, 40%) and in Denmark in 2024 (discovery of Harald East on the Danish Underground Consortium permit).

In 2025, the Company's exploration and appraisal expenditure was $0.8 billion compared to $0.9 billion in 2024 and $1.2 billion in 2023.

2.1.3 Hydrocarbon production

The average daily production of liquids and natural gas was 2,529 kboe/d in 2025, compared to 2,434 Kboe/d in 2024 and 2,483 kboe/d in 2023.

Gas and associated products (condensates and natural gas liquids) represented approximately 46% of TotalEnergies' overall oil and gas production in 2025, compared to 46% in 2024 and 44% in 2023. Crude oil and bitumen represented 54% in 2025, compared to 54% in 2024 and 56% in 2023.

The tables on the following pages set forth TotalEnergies' annual and average daily production of liquids and natural gas by geographical area and for each of the last three fiscal years.

Consistent with industry practice, TotalEnergies often holds a percentage interest in its fields with the balance being held by joint-venture partners (which may include other international oil companies, state-owned oil companies or public entities). TotalEnergies entities may frequently act as the operator, i.e., meaning the party responsible for the execution of technical production on the fields in which it holds an interest. For further information, refer to the table on producing assets by geographical area below.

In 2025, as in 2024 and 2023, the Trading & Shipping unit of the Refining & Chemicals segment marketed substantially all of TotalEnergies' liquids production (refer to the table regarding Trading & Shipping's crude oil sales and supply and petroleum products sales in point 2.5.2.1).

Production by geographical zone

The following table sets forth TotalEnergies' annual liquids and natural gas production by geographical area.

	2025			2024			2023		
	Liquids Mb[(a)]	Natural gas Bcf[(b)(c)]	Total Mboe	Liquids Mb[(a)]	Natural gas Bcf[(b)(c)]	Total Mboe	Liquids Mb[(a)]	Natural gas Bcf[(b)(c)]	Total Mboe

(a) Liquids include crude oil, bitumen, condensates, and natural gas liquids (NGL).
(b) Including *fuel gas* (142 Bcf in 2025, 149 Bcf in 2024 and 144 Bcf in 2023).
(c) Gas conversion ratio: 1 boe = 1 b of crude oil = 5,424 cf of gas in 2025, (5,390 cf of gas in 2024 and 5,388 cf of gas in 2023).

2.2 Exploration & Production segment

The Exploration & Production (E&P) segment encompasses the activities of exploration and production of oil and natural gas, as well as the carbon neutrality activities, conducted in about 50 countries.

Main indicators

1.99 Mboe/d
of hydrocarbons produced in 2025

$15.6 billion
Cash flow from operations excluding working capital (CFFO)[a] in 2025

$9.6 billion
of organic investments[a] in 2025

(a) Refer to the glossary for definitions and additional information on alternative performance measures (APM, Non-GAAP measures) and to point 1.8 for reconciliation tables.

Production

Hydrocarbon production	2025	2024	2023
E&P *(kboe/d)*	1,990	1,947	2,034
Liquids *(kb/d)*	1,467	1,408	1,492
Gas *(Mcf/d)*	2,794	2,880	2,900

Exploration & Production segment financial data

(in M$)	2025	2024	2023
Adjusted net operating income	8,399	10,004	10,942
including adjusted income from equity affiliates	*714*	*742*	*539*
Effective tax rate[a]	49.9%	47.8%	50.0%
Organic investments[b]	9,564	9,060	10,232
Acquisitions net of asset sales[b]	(305)	(207)	(2,706)
Net investments[b]	9,259	8,853	7,526
Cash flow from operations excluding working capital (CFFO)[b]	15,646	17,049	19,126
Cash flow from operating activities	14,949	17,388	18,531

(a) The average tax rate is defined as follows: (tax on adjusted net operating income)/(adjusted net operating income – share of income of equity affiliates – dividends received from investments – impairment of goodwill + tax on adjusted net operating income).
(b) Refer to the glossary for definitions and additional information on alternative performance measures (APM, Non-GAAP measures) and to point 1.8 for reconciliation tables.

Over the year 2025, against a backdrop of an $11/b decline in Brent prices (-13%), Exploration & Production adjusted net operating income was $8,399 million, down 16% year-on-year. Cash flow from operations (CFFO) reached $15,646 million, a year-on-year decrease of 8%, benefiting from accretive production growth, which helped offset $5/b of the Brent price decline.

2.2.1 Presentation of the segment

To responsibly produce the oil and gas that the world needs today and to contribute to the Company's transition, E&P articulates its strategy around the following axes:

- meeting global demand for oil and gas by producing resources with low costs and greenhouse gas emissions, particularly gas, the least emitting fossil energy. Seven major projects, most of which are currently under construction are expected to start by 2030;
- reducing GHG emissions to reduce the intensity of scope 1+2 emissions of its activities:
  - by conceiving designs that will avoid emissions on new projects as much as possible;
  - by implementing projects to improve energy efficiency, eliminate routine flaring, reduce its methane emissions on its operated sites by 80% in 2030 relative to 2020, reduce fuel gas consumption and capture and store emissions on its existing sites;
  - while placing sustainable development at the heart of its operations and projects.

The safety of employees, stakeholders and facilities drives the day-to-day implementation of this strategy.

E&P relies on the commitment, technical expertise and diversity of its employees, its operational excellence and its local roots in Africa, Northern Europe and in the Middle East.

In order to increase cash flow generation and maximize the value of its assets, E&P is pursuing efforts to start its projects on time and within budget, maintain a high level of availability at its facilities, and retain its competitive advantage as a low-cost producer. To this end, the EP is intensifying its cost-reduction program in order to keep its production costs below $5/boe, thereby contributing to the Company's cash saving program (Capex and Opex) over the 2026–2030 period.

In addition, TotalEnergies assesses its E&P investment projects by considering an environment of $50/b and a CO_2 price of $100/t (or the price in force in a given country if this is higher) and focuses on projects with technical costs of less than $20/boe or where the break-even is less than $30/b and GHG emissions intensity (Scope 1+2) is below 16kg CO_2e/boe.

Lastly, the Company continues to dynamically manage its portfolio by restructuring or disposing of its least-performing non-strategic E&P assets and accessing new low-cost and low-emission resources, through exploration on the one hand and acquisition of resources already discovered on the other.

2.2.2 Management of GHG emissions

TotalEnergies has reaffirmed its ambition to produce hydrocarbons while reducing emissions at its facilities to as low as possible (near zero), by 2050.

The goals of E&P in this area, in line with those of the Company, are based on three key elements:

- avoid GHG emissions by prioritizing the production of resources with the lowest impacts in terms of carbon footprint and by designing low-carbon infrastructures and operating procedures;
- reduce GHG emissions by developing and implementing a systematic approach in E&P to identify and implement the best available technologies for reducing GHG emissions (Scope 1+2) and, if necessary, storing captured CO_2 underground; and
- develop nature-based carbon sinks.

To this end, the Carbon Neutrality Division within E&P aims to develop a global approach to generate synergies, and encompasses the following activities:

- Carbon Footprint Reduction (CFR) whose mission is to reduce E&P GHG emissions;
- Carbon Capture and Storage (CCS) whose mission is to reduce the Company's GHG emissions (Scope 1+2) and its clients' emissions by developing a transport and storage offer; and
- Nature Based Solutions (NBS), whose mission is to develop nature-based carbon sinks.

2.2.2.1 Reduction of the carbon footprint

The Carbon Footprint Reduction (CFR) entity manages the reduction of GHG emissions from oil & gas assets, both operated and non-operated, and consolidates the efforts made by all E&P's subsidiaries in this area to improve energy efficiency, reduce fuel gas consumption, eliminate routine flaring and reduce methane emissions of its operated facilities to close to zero by 2030 and to capture and store emissions at its existing sites.

On operated assets, the CFR entity assists the subsidiaries in implementing projects aimed at contributing GHG emissions reduction projects (Scope 1+2) from facilities in order to contribute to the Company's target of reducing 100% operated GHG emissions to below 37 Mt CO_2e by 2025, an objective exceeded in 2025 and to 25-30 Mt CO_2e by 2030, by focusing on four main levers:

- improving energy efficiency as part of the $1 billion program launched by the Company for the period 2023-2025 and the additional program announced in 2024 for the period 2026-2028, also amounting to $1 billion;
- electrifying and supplying renewable energy to facilities;
- reducing routine flaring with a view to eliminating it by 2030;
- reducing methane emissions, to contribute to the Company's goal of lowering them by 80% between 2020 and 2030 or sooner and methane emission intensity below 0.1% of commercial gas produced at Upstream operated oil and gas facilities, aiming for near-zero methane emissions in the Company's operations by 2030 at the latest. In 2025, methane emissions intensity was below 0.1%. In addition, the Company achieved a 65% reduction in its operated methane emissions compared to 2020, exceeding its target of a 60% reduction. To continue progressing toward its 80% reduction objective, 11,000 fixed permanent monitoring equipment were deployed across all operated upstream assets, enabling real-time identification of any methane leaks and the immediate implementation of corrective actions to stop them.

The CFR entity also coordinates:

- the communication with partners and operators in order to encourage them to also implement emissions reduction projects on assets that the Company does not operate;
- the implementation of the OGMP 2.0 (Oil and Gas Methane Partnership 2.0[1]), initiative to which TotalEnergies subscribed in November 2020. In this context, in 2025 for the fifth consecutive year, IMEO – the International Methane Emissions Observatory, part of UNEP (United Nations Environment Program) – recognized TotalEnergies' efforts in the reduction of methane emissions, confirming its "Gold Standard" status (refer to point 1.3.3.4). In addition to the numerous methane detection and measurement campaigns using AUSEA technology (Airborne Ultralight Spectrometer for Environmental Applications) on its operated assets, the Company has also deployed permanent, real-time monitoring equipment, enabling a better understanding of emission sources and leading to mitigation actions.

TotalEnergies has successfully deployed its AUSEA drones with partners in accordance with cooperation agreements with national oil & gas companies and other industrial stakeholders (Petrobras, Sonangol, NNPC, Socar, ONGC, Oil India Limited and Gladstone LNG), to carry out methane detection and measurement campaigns using AUSEA technology, thereby demonstrating the shared commitment to identify, quantify and reduce methane emissions and encouraging the entire oil and gas industry to aim for near-zero methane emission by 2030.

In addition to the continuous efforts deployed on projects to reduce emissions from existing assets, E&P also deploys communication and training actions for employees and partners on climate issues and the need to reduce GHG emissions.

2.2.2.2 CO_2 capture and storage (CCS)

TotalEnergies believes that CCS is one of the necessary levers in the fight against climate change and therefore is developing new businesses to enable its industrial, residential and power-generating customers to capture and store their CO_2 emissions. The Company's objective is to contribute to the development of a CO_2 gross storage capacity of around 10 Mt/y by 2030, for its own facilities and those of its customers.

In **Norway**, TotalEnergies holds a 33% interest in the Northern Lights project, the world's first commercial CO_2 transportation and storage project, with a storage capacity of 1.5 Mt/y for Phase 1. The facilities in operation since August 2025 include a CO_2 reception terminal, a 100 km subsea pipeline and subsea injection facilities for a permanent and secured storage of CO_2 in a reservoir 2,600 meters below the seabed. The first phase, supported by Norway, aims to store emissions from several industrial sites, including a cement plant, Norcem/Heidelberg Materials (0.4 Mt CO_2/y), a waste-to-energy plant in Oslo, Celsio (0.4 Mt CO_2/y), and a Yara ammonia and fertilizer plant in the Netherlands (0.7 Mt CO_2/y).

(1) Source: An Eye on Methane: International Methane Emissions Observatory 2025 Report UNEP (United Nations Environment Programme).

The final investment decision for Phase 2 was taken in March 2025, and covers an additional capacity of 4.1 Mt CO_2/y, part of which is contracted to two emitters: Ørsted in Denmark (0.4 Mt CO_2/y) and Stockholm Exergi in Sweden (0.9 Mt CO_2/y).

TotalEnergies held a 40% interest, since 2023, in the ExL004 CO_2 storage exploration license located 120 kilometers off the coast of Bergen, in 200 meters water depth (the "Luna" project).

In the **Netherlands**, TotalEnergies is participating in the Aramis project (60%) which aims to store CO_2 in depleted offshore gas reservoirs at a depth of approximately four kilometers thanks to new CO_2 transport infrastructure linking Rotterdam to these offshore fields. The detailed engineering studies for the Phase 1 of the project, with a storage target of 2.5 Mt CO_2/y in fields operated by TotalEnergies, are in progress. This storage capacity could be further expanded up to 5 Mt CO_2/y in later phases.

In **Denmark**, TotalEnergies holds the licenses covering the Harald West prospect (a depleted gas reservoir) and the Dagny prospect (a saline aquifer). In October 2025, TotalEnergies divested a 35% interest in the licenses to a potential customer, reducing its stake from 80% to 45% while retaining operatorship (the transaction remains subject to approval by the Danish authorities). In January 2026, TotalEnergies was awarded a 65% interest and operatorship of the Inez license (saline aquifer). Subject to appraisal and evaluation works, these projects, which together constitute the Bifrost Project could ultimately provide storage capacity of more than 15 Mt CO_2/y.

In the **United Kingdom** the Company is part of the Northern Endurance Partnership (10%). This partnership is developping a project consisting of collecting CO_2 in the industrial regions of Teesside and Humberside, transporting it offshore and storing it in a saline aquifer located respectively 145 km and 85 km from the coasts. The final investment decision for Phase 1 of the project (4 Mt CO_2/y) was taken in December 2024, and construction is underway (the country's first CCS project). In the initial phase, the project's infrastructure will enable the collection and storage of emissions from the Net Zero Teesside Power project (power generation). The ongoing appraisal works on the offshore blocks enable the preparation of future expansion phases that could increase the project's total storage capacity beyond 20 Mt CO_2/y.

In the **United States**, TotalEnergies acquired in March 2024, 100% of Talos Low Carbon Solutions which held a 25% interest in the Bayou Bend project in Texas, a 65% interest in the Harvest Bend project in Louisiana and a 50% interest in the Coastal Bend project in Texas. The latter two interests were sold at the end of 2024, as the projects were far away from the Company's assets in the region. The Bayou Bend project provides CO_2 transportation and storage solutions for industrial emitters in the Houston and Beaumont-Port Arthur region, one of the main industrial hubs in the United States. Consisting of a set of permits for underground CO_2 storage, both onshore and offshore, covering an area of approximately 600 km^2 (232 square miles), this project targets a capacity of more than 10 Mt CO_2/y. The Bayou Bend project could contribute to reducing the Company's direct emissions in the U.S. given its proximity to the Port Arthur refinery. In 2024, the project drilled appraisal wells and applied for an injection permit for the offshore area. In 2025, the project entered the FEED study phase for the offshore area, while an injection permit for the onshore area is currently being prepared.

In **Australia**, TotalEnergies holds a 26% interest in the Bonaparte CCS Assessment, a joint venture that has a CO_2 storage assessment permit covering license G-7-AP, off the Australian northwest coast. A seismic acquisition campaign and the drilling of two appraisal wells were completed in 2024 and confirmed the possibility of storing CO_2 on a large scale in the saline aquifer covered by the license. This project is part of a comprehensive action plan aimed at reducing CO_2 emissions from the Ichthys LNG project.

In **Malaysia**, TotalEnergies partnered in 2023, with Petronas and Mitsui to develop a CCS project in the Malaysian basin (Southern Hub). This project aims to develop to store CO_2 in a depleted gas reservoir (Duyong) and in nearby saline aquifers. In October 2025, Petronas, on behalf of the consortium, obtained an offshore assessment permit for CO_2 storage on the Duyong field. The project was selected by the Japanese government as one of its advanced CCS projects that could support the decarbonization of Japan's industries. A MOC (Memorandum of Cooperation) was also signed in October 2025 by the Malaysian and Japanese governments with the aim of developing cross-border CO_2 transportation. In 2026, the project entered into FEED study phase.

2.2.2.3 Nature-based carbon sinks

While TotalEnergies' priority is first to avoid and then to reduce its GHG emissions, the net emissions targets for Scope 1+2 take into account the contribution of nature-based carbon sink projects, that is to say sequestration projects, such as reforestation or regenerative agriculture, or conservation projects which protect environments where significant amounts of carbon are already stored.

TotalEnergies plans to invest up to $100 million per year on average between 2020 and 2030 in these projects to build a carbon credit stock of around 50 Mt. If such a stock is built by 2030 and based on a consumption of 10% of the stock per year from 2030, then TotalEnergies estimates that it could consume around 5 million credits per year from 2030 to partially offset the residual Scope 1+2 emissions of the Company after the priority actions to avoid and reduce its GHG emissions have been carried out.

These credits will be certified according to environmental and social management standards. Projects are designed to respect the resource regeneration cycles and contribute to provide social, economic and environmental co-benefits for local communities, on which they rely.

The carbon credit stock at the end of 2025 amounts to 17.9 million carbon credits (vs. 13.7 million at the end of 2024 and 10.9 million at the end of 2023) certified by major international standards such as Verified Carbon Standard (VCS), American Carbon Registry (ACR), or ANREU (Australian National Registry of Emissions Units). The cumulative budget committed to date for all concluded operations amounts to nearly $653 million over their lifetime, for a cumulative volume of verified credits expected to be 37 million by 2030 and 51 million over their lifetime. The final quantities of carbon credits obtained will depend on the effective implementation of the NBS projects, as well as on methodological revisions for certification and technical updates. They may vary depending on the developments, as well as on any additional projects and investments that the Company may decide to undertake over these periods.

In 2025, TotalEnergies entered into an agreement with NativState, a developer of forest carbon projects based in Arkansas (United States), comprising 13 Improved Forest Management (IFM) projects located in four US states (Arkansas, Louisiana, Mississippi and Tennessee) and covering around 100,000 hectares (247,000 acres).

In 2024, TotalEnergies signed an agreement with Anew Climate, a North American leader in climate solutions, and Aurora Sustainable Lands, a company specialized in carbon management and forest landowner in the U.S., to contribute $100 million to the projects they deploy to protect productive forests from overexploitation and support their conversion to sustainable management practices, enhancing their ability to store more carbon from the atmosphere. In 2025, Anew Climate and Aurora Sustainable Lands developed the planned activities and delivered the expected credits.

In 2023, the Company decided to invest $100 million in the Nature Based Carbon fund managed by Climate Asset Management, mainly targeting the preservation or restoration of three types of ecosystems: degraded natural forests, grasslands impacted by human activity as well as wetlands. In 2024 and 2025, Climate Asset Management managed the investments already made and continued to seek new investment opportunities.

In February 2025, the partners signed a Host Governmental Agreement with the Arab Republic of Egypt and the Republic of Cyprus, establishing a framework that allows Cronos gas to be processed via the existing infrastructure of the Zohr field, located onshore in Egypt, and then liquefied at the Damietta LNG plant, also in Egypt, for export to Europe. Several implementation agreements were signed in October 2025. The partners are working to finalize the development and production plan for Cronos in close collaboration with the Cyprus authorities.

In **Lebanon**, in January 2026, TotalEnergies becomes operator of a new exploration license on Block 8 (35%), in partnership with ENI and QatarEnergy.

TotalEnergies relinquished Block 4 in October 2023 and Block 9 (35%, operator) in March 2026, on which an exploration well was drilled in October 2023.

In **Egypt**, TotalEnergies was the operator of offshore exploration Block 3 (35%), relinquished in June 2024.

In **Syria**, the Company discontinued its activities connected with oil and gas production since December 2011. The Deir ez-Zor license under PSA 88 (50%) and in the Tabiyeh Gas Service Contract (GSC) have been under force majeure since December 2011.

2.3 Integrated LNG segment

Since 2023, the Integrated LNG segment covers the integrated gas chain (including upstream and midstream LNG activities), biogas and other low carbon molecules, gas trading activities, as well as starting January 1, 2026, the LNG bunkering business, previously reported under the M&S segment.

In its final statement, the COP28 recognized the utility of transitional fuels. TotalEnergies shares this conclusion, which reinforces its growth strategy in gas, and particularly LNG. Gas is an energy transition which supports the development of intermittent renewables and rapidly reduces CO_2 emissions through switching from other fossil fuels such as coal that emit significantly more.

Main indicators

$4.7 billion
Cash flow from operations excluding working capital (CFFO)[(a)] in 2025

44 Mt
Volume of LNG sold in 2025

No. 1
US LNG exporter with over **19 Mt** in 2025[(b)]

26
long-term chartered LNG carriers in 2025

19 Mt
Long term regasification capacity in Europe in 2025

Main objectives and ambitions

Tending toward zero
methane emissions by 2030

Hydrocarbon production and LNG sales

Hydrocarbon production for LNG	2025	2024	2023
Integrated LNG *(kboe/d)*	539	487	449
Liquids *(kb/d)*	66	60	58
Gas *(Mcf/d)*	2,608	2,331	2,128

LNG sales	2025	2024	2023
Total LNG sales *(Mt)*	43.9	39.8	44.3
Including sales from equity production[(a)]	*15.1*	*15.5*	*15.2*
Including sales by TotalEnergies from equity production and third party purchases	*38.8*	*34.7*	*40.1*

(a) The Company's equity production may be sold by TotalEnergies or by the joint-ventures.

Hydrocarbon production for LNG was up 11% in 2025 compared to 2024, supported by the acquisition of SapuraOMV in Malaysia and interests in gas permits in the Eagle Ford basin in Texas. LNG sales in 2025 were up 10% in 2024 year-on-year, thanks to a higher spot activity.

Results

(in $ millions, except the average price of LNG)	2025	2024	2023
Average LNG selling price *($/Mbtu)*[a]	9.14	9.80	10.76

Acquisitions net of assets sales[b]	165	1,367	1,096
Net investments[b]	2,734	3,536	3,159
Cash flow from operations excluding working capital (CFFO)[b]	4,698	4,903	7,293
Cash flow from operating activities	5,173	5,185	8,442

(a) Sales in $ / Sales in volume for consolidated and equity affiliates. Does not include LNG trading activities.
(b) Refer to the glossary for definitions and additional information on alternative performance measures (APM, *Non-GAAP measures*) and to point 1.8 of chapter 1 for reconciliation tables.

For the full-year 2025, cash flow from operations excluding working capital (CFFO) amounted to $4.7 billion, supported by 10% growth in production and sales in an environment of low volatility and declining average price of LNG.

2.3.1 Presentation of the segment

TotalEnergies is implementing an integrated strategy for profitable growth in the **liquefied natural gas** (LNG) segment and along the whole natural gas value chain. TotalEnergies is also involved in the trading of LNG and complementary products (liquefied petroleum gas, petcoke and sulfur) and is developing positions in low-carbon gases.

Worldwide LNG market volumes grew by 6% on average between 2016 and 2025[1], thanks to the switch from coal to natural gas. In Europe, gas imports from Russia via gas pipelines, which had already been sharply reduced after Russia invaded Ukraine, fell further when the transportation of gas via Ukraine was stopped at the end of 2024. To mitigate this, Europe has increased its regasification capacity and LNG imports. In 2025, in market conditions that remained tense, gas prices were higher than in 2024 on average. They remained significantly lower than those observed in 2022 and 2023 but still higher than pre-crisis levels. Europe (European Union and United Kingdom) imported 115 Mt of LNG in 2025 compared with 89 Mt in 2024 and 112 Mt in 2023[2].

Worldwide LNG demand is expected to continue to grow by an average of 5% or 6% per year between 2025 and 2030, driven mainly by Asia. New liquefaction projects launched in the wake of rising gas prices, mainly in Qatar and North America, are expected to generate a sharp increase in global production in the years to come.

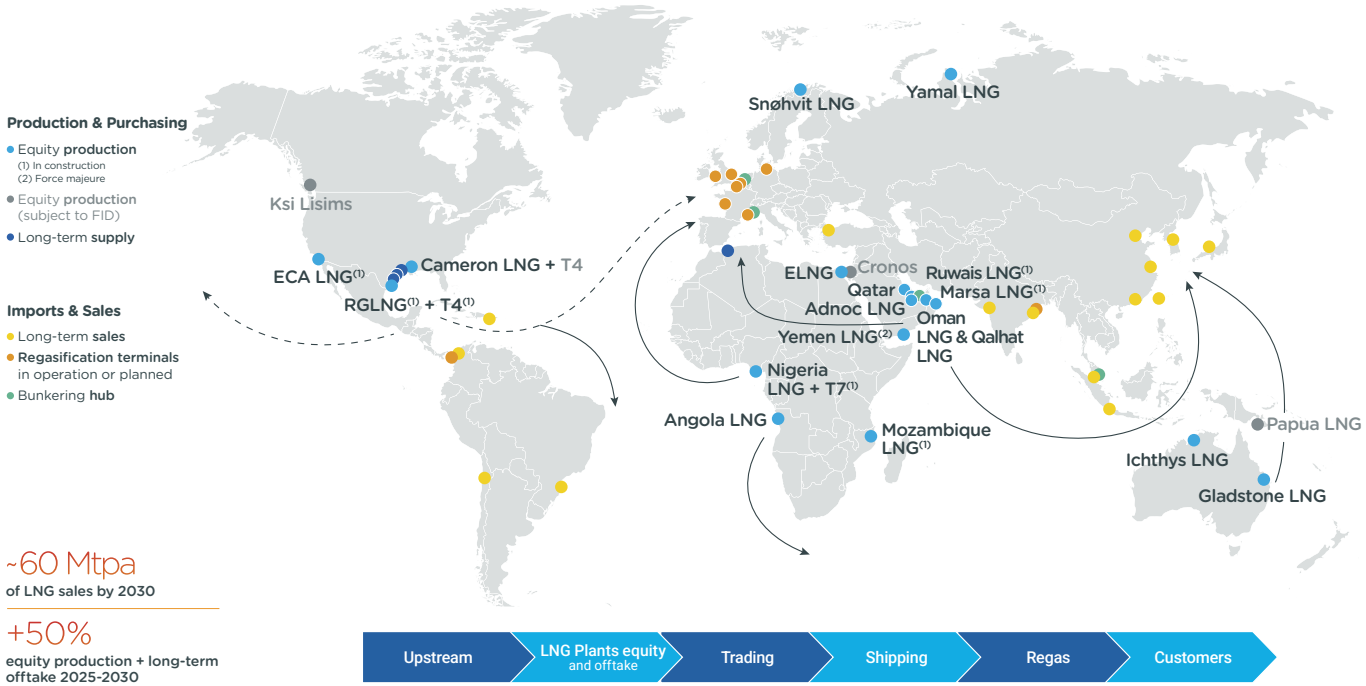

Due to its solid, diversified positions, TotalEnergies is still the world's third-largest player in LNG[3], with a global portfolio of 44 Mt and a global market share of about 10%[4] in 2025. The Company is the leading importer in Europe[5]. TotalEnergies' LNG sales in EU and UK reached 18.4 Mt in 2025 compared to 13.8 Mt in 2024 and to 22.8 Mt in 2023, thanks to 19 Mt/y of regasification capacity. The Company is also the largest exporter[6] from the United States (with more than 19 Mt in 2025).

In accordance with its balanced multi-energy strategy, the Company intends to consolidate its integrated position throughout the LNG value chain and its position as the third-largest global LNG player. Between 2025 and 2030 LNG volumes (from equity and long-term offtake, excluding Russia post 2027) should grow by +50%, relying on a portfolio of competitive, low-cost projects. LNG sales should thus reach about 60 Mt in 2030. The main projects under construction or development include North Field East and North Field South in Qatar, Marsa LNG in Oman, Rio Grande LNG in the United States, Energía Costa Azul in Mexico, NLNG T7 in Nigeria, Mozambique LNG in Mozambique and Papua LNG in Papua New Guinea. TotalEnergies has strengthened its presence across the entire chain, from upstream activities, thanks mainly to its interests in liquefaction plants located in the major production areas, through *midstream* activities, such as transportation, regasification and trading, and through distribution to end customers. In the U.S. and Mexico, the Company also confirms its status as a leading LNG exporter, with the increase of its long-term offtakes (excluding spot) over 17 Mt in 2030. It also remains one of Europe's leading importers, with regasification capacity of close to 20 Mt/y. TotalEnergies intends to focus on improving the flexibility and resilience of its LNG portfolio, in particular by continuing to increase its Brent-indexed sales in Asia. It plans to increase its fleet of long-term chartered LNG carriers to 30 vessels by 2030.

The LNG sold by TotalEnergies on worldwide markets comes in part from equity production in natural gas and condensate fields or liquefaction plants of which the subsidiaries are shareholders (refer to point 2.3.2). It also comes from purchase agreements concluded with third parties (refer to point 2.3.3).

A growing, diversified and flexible LNG portfolio

In response to the issue of methane emissions, TotalEnergies has reinforced in 2024 its target to reach a below 0.1% methane intensity by 2030 on its gas facilities, to extend it to all its upstream oil and gas operated facilities. Thanks to the efforts made, the Company has exceeded in 2025 its objective of methane emissions reduction on operated assets compared to 2020, already increased in 2024 from -50% to -60%, by reaching -65%(1), and targets a reduction by 80% in 2030.

In the **low-carbon gas segment**, the Company intends to develop the production and marketing of **biogas**, mainly in Europe and the United States, in order to meet incorporation obligations and to support its clients who wish to decarbonize their own activities. In Europe, in the context of the REPowerEU plan to end dependence on Russian gas and taking into account the support mechanisms for the development of biogas, TotalEnergies intends to develop its activities by capitalizing on its French and Polish subsidiaries and the portfolio of projects in the United States. At the end of 2025, the gross installed production capacity reached 1.4 TWh/y.

2.3.2 LNG production and liquefaction

Hydrocarbon production for LNG was up 11% in 2025.

LNG production growth is expected to continue in coming years thanks to liquefaction projects under construction (Rio Grande LNG in the USA, NFE and NFS in Qatar, ECA in Mexico, NLNG T7 in Nigeria and Marsa LNG in Oman) or under study.

The information below describes the main development, production and liquefaction activities of the Integrated LNG segment, presented by geographical area. The capacities are expressed on a 100% basis, regardless of TotalEnergies' interest in the asset.

Africa (excluding North Africa)

In **Nigeria**, TotalEnergies holds a 15% interest in Nigeria LNG (NLNG), whose main asset is a liquefaction plant with a total capacity of 22 Mt/y. The project to install an additional 7.6 Mt/y of capacity based on a new liquefaction train is in progress. TotalEnergies is also present in the onshore fields of the OML 58 Block (40%, operator) in the context of its joint-venture with Nigerian National Petroleum Corporation Ltd (NNPC), which has been supplying gas to NLNG for about twenty years. In 2024, the final investment decision for the development of Ubeta gas field was taken in order to supply NLNG. The OML 58 onshore fields also supply gas to the Nigerian domestic market. In addition, TotalEnergies owns a 40% stake in the Ima field, where development studies are underway to supply NLNG plant.

In January 2026, TotalEnergies signed an agreement to sell its 10% non-operated interest in the 3 production licenses (OML 23 and 28 onshore, and OML 77 offshore) of the RAEC joint venture, while retaining a full economic interest in these licenses, which mainly produce gas and currently account for 50% of Nigeria LNG's gas supply. Completion of the transaction is subject to approval by the relevant authorities.

In **Angola**, TotalEnergies holds a 13.6% interest in Angola LNG (ALNG), which owns a gas liquefaction plant of 5.2 Mt/y capacity, located near Soyo, that is supplied by the gas associated with the production of Blocks 0, 14, 15, 17, 18, 31 and 32. The SLGC project (Sanha Lean Gas Connection) on Block 0, which started up in December 2024, helps to strengthen gas supply to ALNG. In 2022, TotalEnergies, a partner in the New Gas Consortium (NGC, 11.8%), announced the final investment decision for the Quiluma and Maboqueiro offshore gas field development project. The project is the first non-associated natural gas project developed in Angola. It will supply the ALNG plant, thereby increasing Angola's LNG production and the availability of domestic gas for the country's industrial development. Production is scheduled to start in the first half of 2026.

In **Mozambique**, TotalEnergies EP Mozambique Area 1 (TEPMA1) holds a 26.5% interest in the Mozambique LNG project (acquisition in September 2019 from Occidental Petroleum Corporation), for which the final investment decision was taken in June 2019. The project includes the construction of two onshore trains with a total capacity of 13.1 Mt/y to liquefy the gas produced by the Golfinho and Atum fields in Offshore Area 1.

(1) Methane emissions from operated facilities were 23 kt in 2025 compared to 29 kt in 2024 and 34 kt in 2023.

In light of the evolving security situation in the north of the Cabo Delgado province in Mozambique, TotalEnergies announced on April 26, 2021, the withdrawal of all personnel from the Mozambique LNG project site in Afungi. Consequently, Mozambique LNG declared force majeure.

In December 2022, on behalf of Mozambique LNG, the Company appointed Mr. Jean-Christophe Rufin(1) to assess the humanitarian situation in the Cabo Delgado province in the north of Mozambique, where Mozambique LNG project is located, and the socio-economic development programs undertaken by Mozambique LNG. In May 2023, TotalEnergies made public Mr. Jean-Christophe Rufin's report, as well as the actions plan adopted by the Mozambique LNG partners based on the report's recommendations. For further information, refer to point 3.6.8.1 in chapter 3.

In 2024, Mozambique LNG conducted limited activities with its contractors, compatible with the security situation, aimed at preserving the site and preparing for the restart of the project once the conditions for lifting the force majeure are met.

In January 2026, TotalEnergies and the Republic of Mozambique announced the full restart of activities for the Mozambique LNG project. This resumption of onshore and offshore activities follows the decision taken by the Mozambique LNG consortium in November 2025 to lift the force majeure declared in 2021 given the improving security situation and the measures implemented by the Government, including and the continuation of cooperation with Rwanda in this area.Construction work has now resumed both offshore and at the Afungi site. First LNG is expected in 2029 as the project progress is currently at 40% – almost all engineering and procurement of main equipments have been executed during the force majeure period.

The sale of nearly 90% of Mozambique LNG future production has been secured through long-term contracts for delivery to customers in Asia and Europe. In addition, part of the gas from the Golfinho and the Atum fields is intended for the domestic market in order to contribute to the country's economic development.

Americas

In the **United States**, TotalEnergies is active in liquefaction through its 16.60% stake in the Cameron LNG plant in Louisiana. The production of the three phase 1 trains with a capacity of 4.5 Mt/y each, began in 2019 (train 1) and 2020 (trains 2 and 3). The study to expand the plant beyond its initial capacity of 13.5 Mt/y is ongoing. In the context of the extension, an agreement has been signed with Sempra Infrastructure, Mitsui & Co., Ltd. and Mitsubishi Corporation aiming to study the development of the Hackberry Carbon Sequestration (HCS) project for the capture, transportation and storage from Cameron LNG's site, in order to significantly reduce its GHG emissions.

In June 2023, TotalEnergies acquired from the U.S. company NextDecade(2) a 16.7% stake in the first phase of the Rio Grande LNG (RGLNG) project, a natural gas liquefaction plant, in South Texas. This first phase is composed of three liquefaction trains for a total capacity of 17.5 Mt/y, and is scheduled to start production in 2027. The terms of the agreement provide for TotalEnergies to offtake 5.4 Mt/y of LNG from this first phase for 20 years. At the end of 2025, TotalEnergies held a 17.10% stake in NextDecade and will have the right to participate in subsequent phases of the project as well as in a carbon capture and storage (CCS) project planned by NextDecade to reduce emissions generated by the LNG project.

In September 2025, TotalEnergies and its partners took the final investment decision regarding RGLNG's fourth train. TotalEnergies holds a 10% direct stake in this project and a 7% indirect stake as a shareholder of NextDecade, and intends to offtake 1.5 Mt of LNG from the future Train 4 every year for 20 years.

TotalEnergies operates assets (held at 96% on average) in the Barnett Shale basin, with around 1,500 active wells grouped in several sites and holds an interest in around 300 non-operated wells. An investment program including drilling and well maintenance activities is being implemented to maintain the production. TotalEnergies measures and physically reduces its greenhouse gas emissions, particularly methane, thanks to the replacement of gas instrumentation with compressed air instrumentation (all active sites equipped since March 2024), spectrometers mounted on drones (AUSEA technology), mobile sensors, infrared cameras with quantification algorithms (LDAR – Leak Detection and Repair program), fixed methane detectors operating continuously (deployment completed across all active operation sites), and fuel controllers (deployment completed with more than 400 compressors equipped).

In 2024, TotalEnergies acquired interests in assets operated by third parties in the Eagle Ford basin in southwest Texas: a 20% interest in the Dorado dry gas assets operated by EOG, in April 2024 and a 45% interest acquisition in dry gas assets operated by Lewis Energy Group, in September 2024.

In **Mexico**, TotalEnergies holds a 16.6% stake in the Energia Costa Azul (ECA) gas liquefaction project (nominal capacity of 3 Mt/y) currently under construction with start-up scheduled for 2026. The Company has agreed to offtake around 1.7 Mt/y.

In **Canada**, in May 2025 TotalEnergies acquired a 5% stake in Western LNG, the developer, shareholder, and future operator of the Ksi Lisims LNG project. The project is fully electrified and powered by hydroelectricity, has capacity of 12 Mt/y and is located on the Pacific coast of Canada (British Columbia). TotalEnergies intends to offtake 2 Mt/y of LNG from this future liquefaction plant, subject to the final investment decision.

Asia-Pacific

In **Australia**, LNG production comes from the Ichthys LNG (26%) and Gladstone LNG (GLNG, 27.5%) projects.

The Ichthys LNG project involves the development of a gas and condensate field located in the Browse Basin. This phased development includes 18 subsea wells (first phase) connected to a platform for gas production, processing and export, an FPSO for condensate processing and export, an 889 km gas pipeline and an onshore liquefaction plant at Darwin, comprising two trains with a total nominal capacity of 8.9 Mt/y of LNG. The second phase of development, including the drilling of an additional 12 subsea wells, was completed in July 2025. Ichthys LNG has reached its production plateau and various adjustments have allowed it to reach 110% of nameplate capacity. A compression project was approved in 2021, to further extend the plateau. In addition to LNG, the facilities produce approximately 110 kboe/d of condensates and LPG.

In August 2023, TotalEnergies and INPEX (operator of the Ichthys LNG project) signed an agreement for the acquisition of PTTEP's 100% interest in the AC-RL7 permit. Under the terms of the agreement, TotalEnergies acquired a 26% stake in the permit, corresponding to its share in Ichthys LNG. INPEX acquired the remaining 74% while assuming operatorship. The permit, located approximately 250 kilometers northeast of the Ichthys offshore facilities, includes the Cash and Maple gas and condensate fields. Their development is expected to contribute to the long-term supply of the Ichthys LNG liquefaction plant.

GLNG is an integrated project with production from the Fairview, Roma, Scotia and Arcadia fields transported to a liquefaction plant on Curtis Island in Queensland, with capacity of 7.8 Mt/y based on two trains. TotalEnergies entered into a *tolling* agreement with GIP Australia (GIP) effective since January 1, 2021, whereby GIP will receive a *tolling* income for 15 years based on the volumes of gas (TotalEnergies' share) passing through the downstream processing facilities. In June 2023, TotalEnergies signed an agreement with Gentari under which the partners plan to jointly develop the Pleasant Hills solar project to supply low-carbon electricity to the gas facilities of the Roma field.

(1) Mr. Jean-Christophe Rufin is one of the co-founders of Médecins sans frontières and honorary president of the NGO Action Against Hunger.
(2) Company listed on NASDAQ.

India

The Adani Total Gas Limited joint-venture (TotalEnergies, 37.4%) has started up in July 2024 a first biomethane plant project in Barsana in the state of Uttar Pradesh, with a capacity of 55 GWh/y (refer to point 1.8.3 of Chapter 1).

Other low carbon molecules

Activities producing hydrogen to be used in the Company's European refineries have been reported to the Refining & Chemicals segment as from July 2025 (refer to point 2.5.1).

In May 2023, TotalEnergies joined forces with Tree Energy Solutions (TES) to study and develop a project in the United States to produce synthetic natural gas (e-NG) from renewable hydrogen and CO_2 of biogenic origin. TotalEnergies and TES have signed, with Osaka Gas, Toho Gas, and Itochu, a Joint Development and Operating Agreement relating to the Live Oak project, granting the three Japanese companies a combined 33.3% stake (as opposed to 33.35% each for TotalEnergies and TES), with target capacity of around 250 MW for electrolysis and 75 kt/y for methanation.

Following the acquisition of the entire capital of Total Eren concluded in July 2023, some of the development activities for renewable hydrogen projects are continuing as part of a new partnership through the TEH2 joint-venture (80% owned by TotalEnergies and 20% by the EREN group). TEH2 is developing renewable hydrogen production projects in different regions, such as North Africa, South America, and Australia. In 2024, TEH2 joined forces with Verbund to develop a project in Tunisia and with CIP and A.P. Møller Capital for a project in the Kingdom of Morocco.

2.4 Integrated Power segment

Since 2023, the Integrated Power segment covers the integrated electricity chain and in particular, electricity production, storage, trading and gas-electricity marketing activities to BtB and BtC customers.

Main indicators

48.1 TWh
Net production of electricity in 2025 including **31.4 TWh** from renewable sources

43.3 GW
Gross installed power generation capacity at year-end 2025, of which **34.1 GW** from renewable sources

$2.6 billion
Cash flow from operations excluding working capital (CFFO)[a] in 2025

$2.8 billion
Net investments[a] in 2025

Main objectives and ambitions

100-120 TWh

(a) Refer to the glossary for definitions and additional information on alternative performance measures (APM, Non-GAAP measures) and to point 1.8 of Chapter 1 for reconciliation tables.

In 2025, Integrated Power cash flow from operations excluding working capital (CFFO) amounted to $2.6 billion, in line with annual guidance. Production activities (including renewables and gas-fired power plants) accounted for 55% and marketing activities (B2B, B2C and trading) accounted for 45%.

2.4.1 Presentation of the segment

Electricity is a high-growth market in which TotalEnergies' strategy is to develop a profitable and differentiated integrated business model, which it aims to make one of the drivers of the Company's cash flow (CFFO[(1)]), alongside oil and gas. TotalEnergies plans to increase its net power production to 100-120 TWh, mainly from renewable sources by 2030. It was 48.1 TWh in 2025, compared to 41.1 TWh in 2024 and 33.4 TWh in 2023.

TotalEnergies intends to replicate its integrated oil & gas model in the Integrated Power segment in order to achieve a profitability (ROACE[(2)]) of around 12% by 2028, equivalent to that of its oil & gas activities in a Brent price environment of $60/b.

The Company's strategy is to build a competitive portfolio of renewable (mainly solar, onshore and offshore wind) and flexible (CCGT, battery energy storage systems) assets in order to expand its electricity trading activities, provide its customers with low-carbon electricity available 24 hours a day (Clean Firm Power), and meet the growing demand from data centers.

(1) Refer to the glossary for definitions and additional information on alternative performance measures (APM, Non-GAAP measures) and to point 1.8 of Chapter 1 for reconciliation tables.
(2) Refer to the glossary for definitions and additional information on alternative performance measures (APM, Non-GAAP measures) and to point 1.8 of Chapter 1 for reconciliation tables.

In this context, the Company announced in November 2025 the acquisition of 50% of EPH's flexible generation portfolio in Europe. This transaction[1] should allow the Company to target a positive cash flow (CFFO) as early as 2027, one year earlier than previously planned. In addition, this transaction reinforces the integration of TotalEnergies' LNG value chain with its electricity production. Thus, the additional net electricity production generated, estimated at 15 TWh/y, will provide added value to approximately 2 Mt/y of LNG.

TotalEnergies intends to focus its development primarily on deploying an integrated model in its key markets (Europe, the United States, and Brazil), which will represent around 70% of its electricity production. In these markets, which are deregulated, the Company anticipates sustained and volatile electricity prices, in a context of strong growth in electricity demand reinforced by data centers' needs and tensions on the supply side. The Company implements on these markets its integrated strategy across the electricity value chain thanks to a production portfolio balanced between renewable and flexible capacities, by keeping around 30% of its electricity production exposed to market price fluctuations, in order to capture additional margins in a volatile market, and by strengthening its electricity trading activities and its sales to end customers. In this context, TotalEnergies is developing specific expertise in short-term electricity market trading, flexibility management activities, and the Corporate PPA (Power Purchase Agreement) market. In parallel, TotalEnergies leverages its scale effect in equipment purchase to optimize its investment costs and industrialize the operation of its renewable assets using digital technology to lower operating costs.

In other geographies, TotalEnergies is implementing a targeted growth strategy:

- in oil and gas producing countries, to support the Company's historical activities, reduce its emissions through renewables, and contribute to these countries' energy transition;
- in the rest of the world, by selectively developing renewable projects, particularly in markets whose size allow for scale effects (such as India and South Africa), and through strategic partnerships with local players.

Finally, the Company plans to monetize renewable projects located in non-strategic countries and to reinforce its capital allocation discipline. This refocusing aims to improve profitability, simplify the geographic portfolio, and accelerate the deployment of the integrated model in markets offering the strongest value potential.

2.4.2 Power generation from renewable sources

To develop its renewable electricity generation capacity, TotalEnergies is pursuing organic growth, targeted acquisitions and a capital recycling strategy. Consequently, in April 2025, TotalEnergies completed the acquisition of the German developer VSB Group, which had over 500 MW of renewable capacity in operation or under construction mainly in Germany and France, and a pipeline of 15 GW of wind, solar and battery storage technologies, mainly across Germany, Poland and France. In July 2023, TotalEnergies finalized the increase from 30% to 100% of its shareholding in Total Eren. In line with its business model, and in order to maximize the value of its portfolio and share risks, TotalEnergies sold 50% stakes in renewable asset portfolios totaling 2.7 GW in North America and Europe in 2025.

Net renewable power production reached 31.4 TWh in 2025 (compared to 26.0 TWh in 2024 and 18.9 TWh in 2023).

Gross installed renewable power generation capacity amounted to 34.1 GW at year-end 2025 compared with 26 GW at year-end 2024 and 22.4 GW at year-end 2023. At year-end 2025, TotalEnergies had a portfolio of renewable power generation gross capacities of close to approximately 109 GW (installed, under construction and in development).

Gross installed power generation capacity from renewables

Solar and onshore wind

France

The Company develops, builds and operates **renewable electricity generation** projects. It operates more than 700 onshore wind, solar, hydroelectric and battery assets for an installed gross capacity of approximately 2.5 GW at year-end 2025, of which 2 GW in metropolitan France (compared to 1.8 GW at year-end 2024 and 1.6 GW at year-end 2023)[1].

In 2025, TotalEnergies commissioned roughly 200 MW of capacity in Metropolitan France, including a 45 MW solar facility in the Landes region in December. In 2024, TotalEnergies commissioned a 63 MW wind farm in the Marne region. In 2023, it commissioned a solar power plant with a gross capacity of 25 MW and a battery energy storage facility at its Grandpuits site, two wind farms and a solar power plant with a total installed capacity of approximately 29 MW as well as the Torrent de Gavet hydroelectric power plant, producing approximately 9.5 GWh/y.

In addition, the Company develops agrivoltaic projects that respond to the challenges of the agricultural world, in particular through a partnership agreement with the National Federation of Farmers' Unions (FNSEA) with the aim of promoting the emergence of circular economic networks, the acceptability of projects and the sharing of value with farmers. In 2023, the Company had acquired Ombréa, a leader in agrivoltaics in France enabling in particular to accelerate its development in this field.

Finally, in line with its portfolio optimization strategy, in late 2025 TotalEnergies sold 50% of a 270 MW portfolio of renewable projects in France.

Rest of Europe and CIS

Gross installed capacity by technology and country at December 31, 2025 *(MW)*

	Gross installed capacity			
	Solar	Onshore wind	Hydroelectric	Total
Portugal	80	526	33	**639**
Greece	154	265	–	**419**
Spain	367	–	–	**367**
Turkey	5	277	166	**448**
Italy	44	41	–	**85**
Poland	–	124	–	**124**
Bulgaria	14	–	–	**14**
Europe – other countries	37	446	82	**565**
Uzbekistan	131	–	–	**131**
Kazakhstan	128	–	–	**128**

In the **United Kingdom**, in June 2025 TotalEnergies acquired a portfolio of solar projects under development with total capacity of 350 MW from Low Carbon.

In **Germany,** in 2025, VSB brought into service the 106 MW Elster project. This is in addition to the two agrivoltaic projects (163 MW, 100%) acquired by TotalEnergies in 2024 and the portfolio of VSB projects in Germany acquired in 2025.

In **Belgium,** TotalEnergies inaugurated in March 2026 a floating solar power plant with a capacity of 31 MW, located in Obourg on a former chalk quarry site that has been rehabilitated into a lake. The solar power plant produces 30GWh per year of renewable electricity, which is self-consumed by Holcim's industrial facilities, making it the largest floating solar power plant in Europe dedicated to self-consumption.

In **Spain**, Guillena solar power plant (263 MW, 100%) was commissioned in December 2024. Final investment decisions of the San Pedro, Basilicas and Alamos solar projects (65%) were taken, increasing the capacity of the projects under construction to 335 MW.

In **Portugal**, in July 2025 TotalEnergies sold 50% of its 604 MW portfolio of renewable assets in production (solar, wind and hydro). In September 2025, it also started the construction of 40 MW of hybridized projects that consist in the addition of solar capacity to wind assets in production.

In **Greece**, the construction of the Serres project (50 MW, 100%) began in March 2025. The Xirokambi solar project (70 MW, 100%) came into operation in February 2024. In December 2025, TotalEnergies closed the sale of 50% of its 424 MW wind and solar project portfolio located in Greece to Asterion Industrial Partners. The Company retains a 50% stake and remains the operator of the assets. Besides, TotalEnergies will offtake and market most of the electricity produced by these assets when they stop benefiting from the regulated tariffs.

(1) Including 133 MW of BESS capacity.

2.5 Refining & Chemicals segment

The Refining & Chemicals segment includes the Refining & Chemicals activities described in point 2.5.1 and the Trading-Shipping activities described in point 2.5.2.

Main indicators

Among the world's **15** largest integrated producers[(a)] based on refining and petrochemical capacities

1.8 Mb/d
Refining capacity at year-end 2025

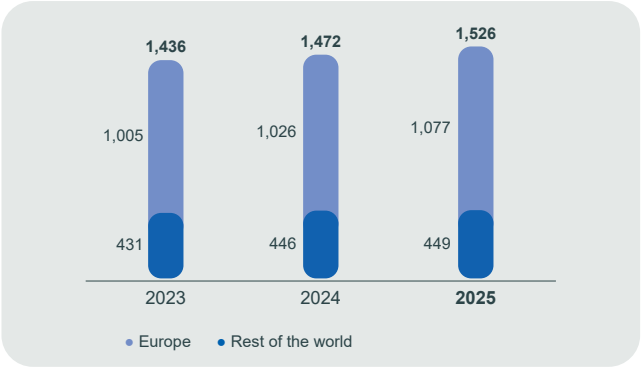

One of the **leading** traders of oil and refined products worldwide

40%
Decrease in CO_2 emissions Scope 1+2 compared to 2015

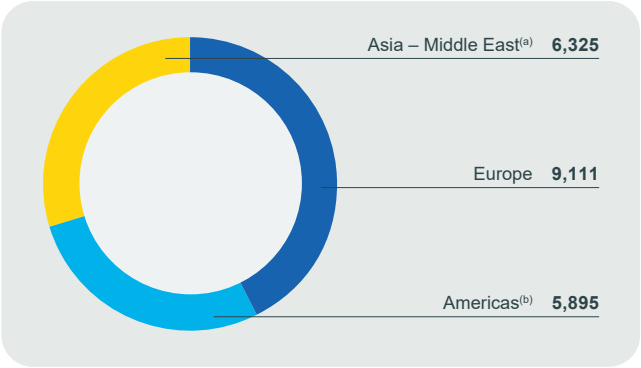

$1.5 B
Organic investments[(b)] in 2025 for Refining & Chemicals activities

(a) Based on publicly available information, refining and petrochemical capacities at year-end 2024.
(b) Refer to the glossary for the definition and further information on alternative performance measures (Non-GAAP measures) and to point 1.8 of chapter 1 for reconciliation tables.

Refinery throughput *(in kb/d)*

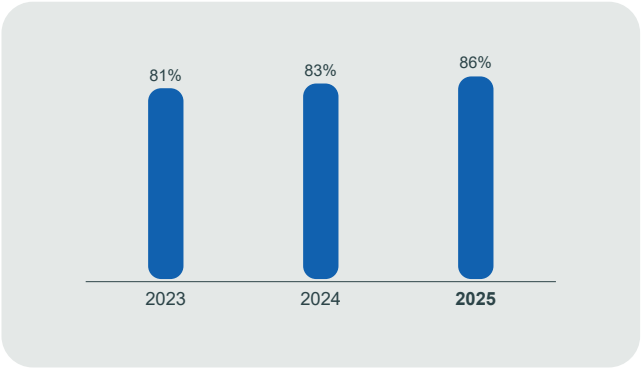

Petrochemicals production capacity by geographical area *(kt)*

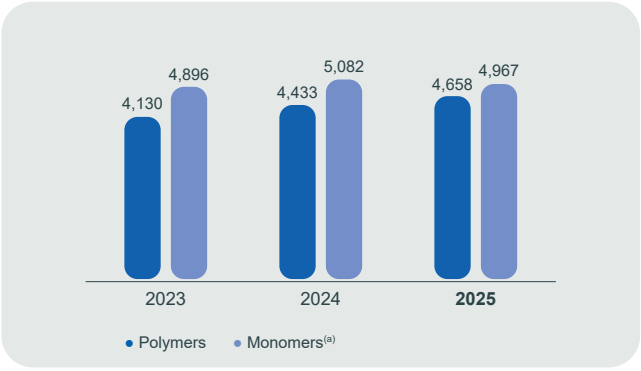

(a) Including interests in Qatar, 50% of Hanwha TotalEnergies Petrochemical Co. Limited and 37.5% of SATORP in Saudi Arabia.
(b) Including 50% of the joint-venture between TotalEnergies and Borealis.

Refining utilization rate[(a)] *(in %)*

(a) Based on distillation capacity at the beginning of the year.

Production of petrochemicals *(in kt)*

(a) Olefins

Refining & Chemicals segment financial data

Results *(in M$)*	2025	2024	2023
Adjusted net operating income	2,378	2,160	4,654
Organic investments[(a)]	1,464	1,711	2,040
Acquisitions net of assets sales[(a)]	(27)	(173)	(118)
Net investments[(a)]	1,437	1,538	1,922
Cash flow from operations excluding working capital (CFFO)[(a)]	3,798	3,760	5,853
Cash flow from operating activities	3,459	3,808	7,957

(a) Refer to the glossary for definitions and additional information on alternative performance measures (APM, Non-GAAP measures) and to point 1.8 of chapter 1 for reconciliation tables.

For the full year, adjusted net operating income and cash flow from operations excluding working capital (CFFO) amounted to $2,378 million and $3,798 million, with higher refining margins offsetting the decline in petrochemical margins.

2.5.1 Refining & Chemicals

Refining & Chemicals' activities include refining, base petrochemicals (olefins and aromatics); polymer derivatives (polyethylene, polypropylene, polystyrene and hydrocarbon resins), including biopolymers and recycled polymers obtained from chemical or mechanical recycling, the production of biofuels from the transformation of biomass; the production of specialty fluids; and, since July 2025, the development of green hydrogen volumes intended to supply the Company's european refineries, previously reported in the Integrated LNG segment. The Refining-Chemicals business also includes Hutchinson's elastomer processing activities.

Refining & Chemicals aims to constitute a safe, efficient and innovative industrial complex. The Refining & Chemicals strategy integrates the constant requirement for safety, a core value of TotalEnergies, and embedded the energy transition strategy of the Company. It does so through controlling its energy consumption and CO_2 emissions of its operations (Scope 1+2), developing low-carbon solutions, particularly in biomass, and adapting its activities in Europe.

Its strategy is based on:

- continuously improving the competitiveness of refining and petrochemicals activities by making optimal use of production assets, concentrating investments on its large, integrated platforms reducing energy consumption and CO_2 emissions linked to its operations;
- growing petrochemicals, mainly in the United States and the Middle East, by exploiting the proximity of cost-effective oil and gas resources in order to supply growing markets, particularly in Asia; and
- developing low carbon activities, on the one hand, through the short term in biofuels (in particular Sustainable Aviation Fuel (SAF)), and over the longer term, as technological costs decline, through synthetic fuels produced from CO_2 and green hydrogen (e-fuels), biopolymers and plastic recycling solutions, and on the other hand in materials that help enhance the energy efficiency of TotalEnergies' customers, particularly in the automotive market.

Biofuels

Biofuels meeting European standards reduce CO_2 emissions by at least 50% compared to their equivalent fossil fuels[1] and demand for these products is supported by government policies aimed at achieving carbon neutrality (net zero emissions).

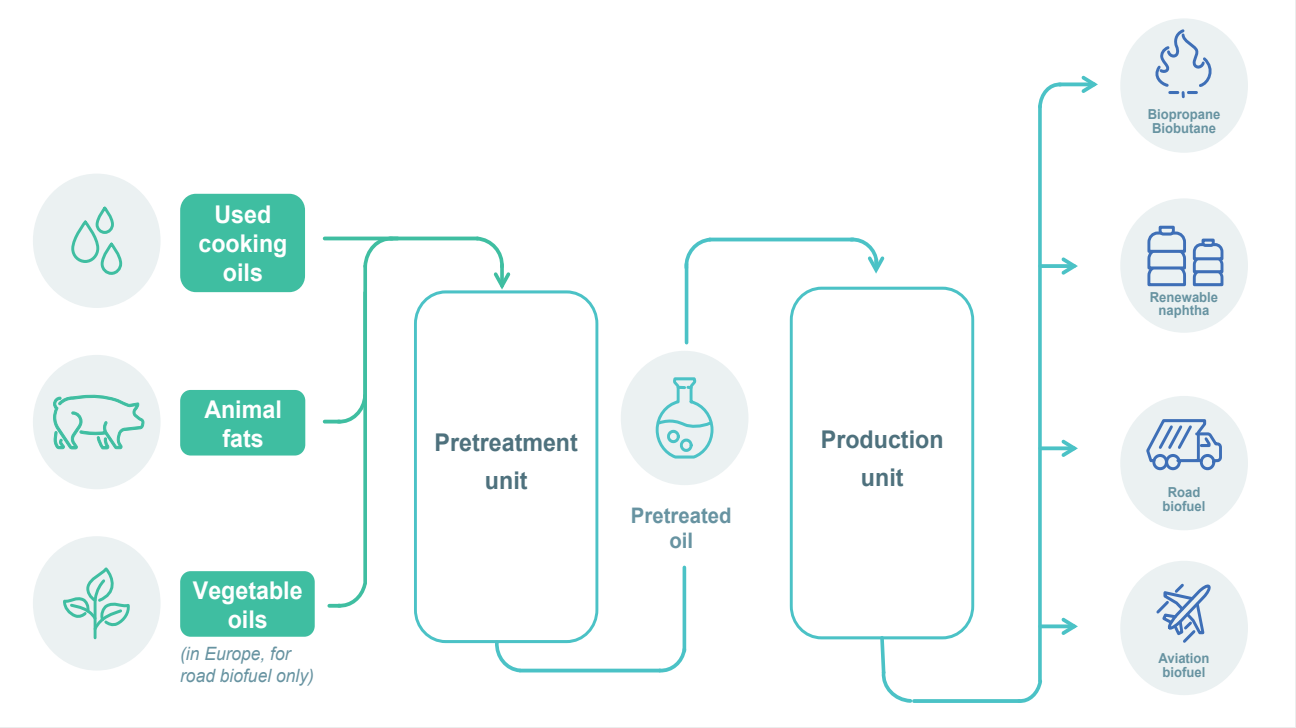

The growth of the biofuels market is driven by the segment covering the renewable diesel and SAF produced by hydrotreating vegetable oils or raw materials from the circular economy (animal fat and used cooking oil, etc.).

The aviation sector has set itself the goal of achieving carbon neutrality by 2050[2]. Achieving this target is expected to involve the incorporation in fossil fuels of a growing portion of SAF, which is the most effective solution for reducing CO_2 emissions from air transport, in the absence of an industrial alternative to liquid fuel in the short to medium term.

The outlook for growth in demand for SAF is also supported by the various regulations. For example, in Europe, the ReFuelEU Aviation regulation, launched as part of the EU's "Fit for 55" legislative package, favors the development of SAFs in the European Union with, among other things, the implementation of obligatory progressive minimum incorporation mandates: 2% since January 1, 2025, 6% (of which 1.2% synthetic fuel) in 2030 and 70% (of which 35% synthetic fuel) in 2050.

The hydrotreatment of raw materials from the circular economy, including animal fats and used cooking oils (as well as vegetable oils depending on local regulations), constitutes one of the main production routes for SAF.

Diagrammatic representation of production of biofuels by hydrotreatment

TotalEnergies intends to become a leader in the production of SAF, relying mainly on its existing refining assets (conversion, co-processing and developments on existing platforms) and aims to achieve SAF production capacity of 0.5 Mt/y by 2028, in line with developments in demand in Europe, the U.S., the Middle East, and Asia.

In Europe, in order to respond to the call from its aeronautical customers, in the context of the gradual increase in the European SAF blending mandate, set at 6% for 2030, the Company is mobilizing its Grandpuits and La Mède platforms. In parallel, the Company is developing coprocessing capacities on its Normandy, Antwerp and Leuna platforms, enabling up to 10% of SAF incorporation levels in 2030. In September 2024, the agreement signed in 2022 between TotalEnergies and Air France for the supply of 800 kt of SAF to the Air France–KLM group, was reevaluated to reach-up to 1.5 Mt of SAF over a 10 year period, through 2035, thus contributing to Air France's objective of incorporating at least 10% of SAF on all its flights by 2030, which goes beyond regulatory obligations.

In 2025, TotalEnergies produced 397 kt of biofuels (renewable diesel, SAF and ETBE), compared to 292 kt in 2024 and 331 kt in 2023, and 79 kt of other co-produced chemical biocomponents (bionaphtha, etc.), compared to 69 kt in 2024 and 78 kt in 2023, mainly at the La Mède and Feyzin sites in France.

(1) According to the EU's RED III (Renewable Energy Directive).

2.6 Marketing & Services segment

Marketing & Services (M&S) includes the worldwide supply and marketing activities of petroleum products and services, low-carbon fuels and new energies for mobility. It aims to support customers in their transition toward more sustainable energy and mobility, and to contribute to the TotalEnergies transition strategy.

M&S has a direct presence in almost 100 countries, serving customers with a wide range of needs in terms of energy and services. It caters to professional customers (transportation, manufacturing, agriculture, etc.) and to individual customers through its network of almost 12,800 service stations and close to 90,000 EV charging points(1), all bearing the Company's brands.

Main indicators

No. 1
retail distribution network in France and in Africa(a)

No. 4
worldwide distributor of inland lubricants(b)

Nearly 13,000
branded service stations(c) as of December 31, 2025

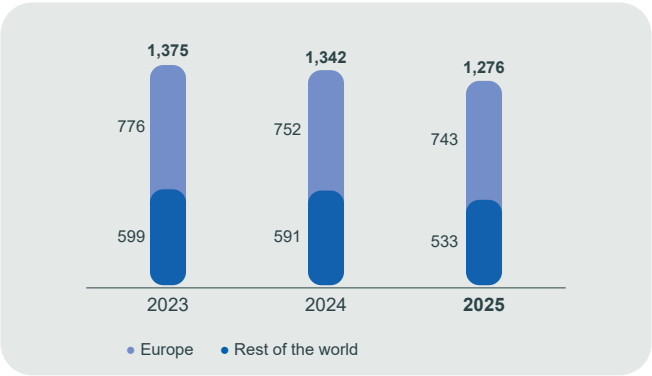

Nearly 90,000
charging points operated and supervised as of December 31, 2025

Main objectives

Over 300
multi-energy sites in France by 2028

(a) France: Report *France Marketing and Retail, October 2025,* S&P Global, based on the number of service stations/Africa: TotalEnergies data, based on the number of service stations at year-end 2024.
(b) Report *Global Lubricants - Company Positioning Overview 2026*, S&P Global, based on 2024 estimated market shares.
(c) TotalEnergies (including TotalEnergies Contact, Access, Elf, Elan, and AS24. Including service stations owned by third parties under the Company's brands. Third-party service stations that only have terminals accepting the AS24 card are not counted.

Sales of petroleum products(a) *(in kb/d)*

Sales of petroleum products were down by 5% in full-year 2025, reflecting the refocusing of the portfolio on higher-margin activities.

(a) Excludes international (*trading*) and bulk refining sales.

Marketing & Services segment financial data

Results *(in M$)*	2025	2024	2023
Adjusted net operating income	1,373	1,360	1,458
Organic investments(a)	775	951	1,065
Acquisitions net of assets sales(a)	(166)	(1,089)	(1,924)
Net investments(a)	609	(138)	(859)
Cash flow from operations excluding working capital (CFFO)(a)	2,425	2,319	2,318
Cash flow from operating activities	2,835	2,901	1,957

(a) Refer to the glossary for definitions and additional information on alternative performance measures (APM, Non-GAAP measures) and to point 1.8 of chapter 1 for reconciliation tables.

Adjusted net operating income of the Marketing & Services segment was US$1,373 million in 2025, stable over the course of the year. Cash flow from operations excluding working capital (CFFO) was up by 5% compared with the previous year, with $2,425 million in 2025, the unit margins overcompensating the decrease in volumes of 5%.

(1) Operated and supervised charging points.

2.6.1 Presentation of the segment

M&S formulates and markets various ranges of petroleum fuels, lubricants, and associated services, both through the service station network (shops, catering, washing, etc.) and to industrial customers. It also offers its clients new forms of energy and mobility services such as biofuels (including sustainable aviation fuel (SAF)), EV charging, natural gas, biomethane and hydrogen for road vehicles, aircraft and ships.

M&S has a strong presence in Western Europe and in Africa, regions in which TotalEnergies is a leading player in the distribution of petroleum products(1).

The M&S segment's strategy is to provide its customers with more affordable, more reliable, and more sustainable energy.

As part of the Company's integrated model regarding the petroleum chain, M&S aims to bring its sales volumes into line with the Company's production of oil and refined products by 2030. To achieve that, M&S has been arbitraging its sales of low-margin petroleum products since 2020.

At the same time, M&S's ambition is to continue growing by developing new low-carbon energies.

Market environment and trends

The development of regulatory frameworks or tax incentives aimed at reducing greenhouse gas emissions promotes the development and adoption of low-carbon energies, and contributes to the markets' transformation, with contrasting geographic dynamics.

Therefore, by 2050, global energy demand for transportation is expected to have changed significantly, with different energy mixes depending on the types of use. The Company made public in November 2025 the TotalEnergies Energy Outlook 2025, which updates the scenarios of the global energy system evolution by 2050 developed by TotalEnergies, and which anticipates that:

- for light vehicles, electrification will tend to become more widespread and will reduce absolute energy demand due to the better efficiency of electric motors (compared to thermal engines);
- the electrification of heavy trucks will become significant, gradually replacing the use of fuels, while hydrogen may be used in niche use cases (dedicated fleets);
- in the aviation and marine transport segments, the drive to reduce carbon emissions will favor a shift in the energy mix toward more sustainable fuels derived from the circular economy (such as animal fats and used cooking oils).

However, these trends will be implemented at different paces depending on the geographical regions. The Company estimates that:

- in Europe, oil demand for road transportation purposes should decline as the vehicles fleet electrification progresses, supported by the European Green Deal (European Union measures aimed in particular at achieving carbon neutrality by 2050);
- in Africa, the pace of growth in oil demand should remain strong until 2050;
- in China, demand for liquid fuels could peak around 2030 as a result of increasing electrification: more than 68% of new light vehicles are likely to be fully electric or plug-in hybrids by 2035.

M&S strategy

In this rapidly changing environment, M&S has adopted a "value over volume" strategy, while also seeking to reduce more quickly the carbon footprint of the products it sells.

Network

As regards its network of service stations, M&S intends to capitalize on its leading position in terms of number of service stations in France and Africa(2), with the aim of:

- to increase revenues from services in stations (stores branded Bonjour, washing carried by the Wash brand, catering where M&S develops partnerships with leading brands, and mobility services);
- developing its network of multi-energy service stations in France, with the aim of having over 300 multi-energy sites in France by 2028;
- to grow in Africa and certain other markets that offer niche positions.

Lubricants

As regards lubricants, which in the vast majority of cases do not generate GHGs when used(3), the main aspects of the M&S development plan are as follows:

- maintain consistent efforts to focus on more high-end products (through premium and specialty products);
- focus growth efforts on high-value-added segments of the manufacturing industry (mining, metals, cement, etc.);
- develop a range of circular and more sustainable lubricants with the incorporation of re-refined base oils and the use of ecodesign in new products and packagings.

B2B activities

In the B2B segment, M&S intends to develop low-carbon solutions for its customers. Growth in this segment is based on supporting customers in their energy transition (for example by offering them biofuels such as HVO). In aviation, M&S develops the sales of SAF, in line with the SAF mandates and its clients' demand.

New energies for mobility

As regards electromobility, M&S has a selective development strategy in Europe, targeting the market segments where it can establish a strong position.

For **light vehicles**, M&S prioritizes the following segments:

- charging points of 150 kW or more in France, particularly on highways and in urban hubs; and
- on-street charging, as part of financial partnerships involving external funding.

For **heavy trucks**, M&S prioritizes road transport carriers by developing its in-depot electric charging business, which it launched in 2023 (including the supply of electricity).

(1) TotalEnergies data.
(2) TotalEnergies data (based on the number of branded service stations).
(3) In most cases, these products are not intended to be burnt in order to produce energy. Accordingly, they are not regarded as fuels under GHG Protocol – Category 11 (refer to glossary or point 5.2.2.1 C. of chapter 5 for further details). They produce limited amounts of GHGs compared to fossil fuels.

M&S's roadmap is based on a significant multi-year organic investment plan (approximately $0.8 billion in 2025). It is based on a balance between distributing conventional fuels on the one hand, and providing services and products which use emits little CO_2[1] on the other. In addition, TotalEnergies makes selective investments in electromobility, in line with the pace of market adoption.

Furthermore, M&S pursues its digital innovation strategy so as to develop new offers tailored to different markets and to improve its operational efficiency.

Finally, as part of its activities, M&S holds minority interests, through its subsidiaries, in two refineries in Africa[2]. The Refining & Chemicals business is presented in point 2.5.

2.6.2 Petroleum products sales

The following table shows M&S's[a] sales of petroleum products by geographical area as of December 31:

(kb/d)	2025	2024	2023
Europe	743	752	776
France	*398*	*401*	*410*
Europe excluding France	*345*	*351*	*366*
Africa	327	351	357
Middle East[b]	49	48	46
Asia-Pacific[c]	89	108	111
Americas	68	83	85
Total	**1,276**	**1,342**	**1,375**

(a) In addition to M&S's petroleum product sales, TotalEnergies' sales include international trading (2,719 kb/d in 2025, 2,492 kb/d in 2024, and 2,173 kb/d in 2023) and bulk refining sales (361 kb/d in 2025, 384 kb/d in 2024, and 405 kb/d in 2023).
(b) Including Turkey.
(c) Including the Indian Ocean islands.

2.6.3 Service stations breakdown

The table below shows the geographical breakdown of the Company-branded[a] service stations:

As of December 31	2025	2024	2023
Europe[b]	5,309	5,331	5,568
of which France	*3,256*	*3,279*	*3,319*
Africa	4,287	4,521	4,501
Middle East	1,243	1,162	1,125
Asia-Pacific[c]	1,019	984	2,217
Americas	547	781	782
AS24 network (for heavy trucks)	370	369	378
Total	**12,775**	**13,148**	**14,571**

(a) TotalEnergies (including TotalEnergies Contact), Access, Elf, Elan and AS 24, including service stations owned by third parties and those currently being converted. Turkey is included under the Middle East region.
(b) Excluding the AS 24 network.
(c) Including the Indian Ocean islands.

2.6.4 Electric vehicle charging points operated and supervised

As of December 31	2025	2024	2023
France	25,068	24,295	21,361
Benelux	43,411	35,669	25,575
Germany	7,567	6,969	5,210
United Kingdom	3,308	2,825	2,478
Rest of Europe	737	684	576
Asia-Pacific	9,484	7,358	4,745
Rest of the world	252	164	123
Total	**89,827**	**77,964**	**60,068**

(1) Services (foodservice, vehicle washing, convenience stores). Products (lubricants, bitumens, liquefied petroleum gas for cooking etc.).
(2) The Company finalized the sale of its minority interests in the Natref (National Petroleum Refiners of South Africa) and SIR (Société Ivoirienne de Raffinage) refineries in December 2024 and July 2024 respectively.

8.2 Consolidated statement of income

TotalEnergies

For the year ended December 31, *(M$)*[a]		2025	2024	2023
Sales	(notes 3, 4, 5)	**201,196**	**214,550**	**237,128**
